EXECUTIVE SUMMARY

This report assesses Italy's economy in the light of the European Commission's Annual Growth Survey published on 16 November 2016. In the survey, the Commission calls on EU Member States to redouble their efforts on the three elements of the virtuous triangle of economic policy — boosting investment, pursuing structural reforms and ensuring responsible fiscal policies. In so doing, Member States should focus on enhancing social fairness in order to deliver more inclusive growth. At the same time, the Commission published the Alert Mechanism Report (AMR) that initiated the sixth round of the macroeconomic imbalance procedure. The in-depth review, which the 2017 AMR concluded should be undertaken for the Italian economy, is presented in this report.

A moderate recovery continued in 2016. Real GDP is expected to have grown by 0.9 % in 2016 after 0.7 % in 2015 (and growth is set to remain around 1 % in 2017-2018). However, the projected recovery is set to remain more moderate than in the euro area. Global demand dynamics are expected to lead to stronger export growth albeit external competitiveness is not yet improving. In the banking sector, the high level of non-performing loans compounded by structurally low profitability weakens banks' capacity to support investment and economic recovery. Headline HICP inflation is expected to accelerate to 1.4 % in 2017 and 1.3 % in 2018, from around zero in 2014-2016, mainly due to higher energy prices.

The labour market is improving gradually. Labour market conditions have been improving since 2014, with headcount employment growing by 0.8 % in 2015 and 1.2 % in 2016, thanks to labour market reforms, the abolition of regional taxes on permanent employment, and temporary tax incentives for new permanent hires. Employment is expected to increase further in 2017-2018, albeit at a more moderate pace. Labour market participation is also increasing. The higher activity rate supports growth prospects in the medium term, but in the short term it entails a higher unemployment rate, which is set to remain above 11 % in 2017-2018 given the modest recovery.

However, longstanding structural weaknesses and the legacy of the crisis continue to weigh on the economic recovery. Italy's real GDP growth

was close to zero over the last 15 years, as against average annual growth of around 1.2 % in the rest of the euro area, as productivity dynamics diverged. Due to the crisis, the public debt ratio grew to around 133 % of GDP in 2016 from the trough of around 100 % in 2007. Traditional regional divides strengthened while long-term and youth unemployment increased sharply, with possible permanent effects on growth. The at-risk-of-poverty-or-social-exclusion rate rose, with children and people with a migrant background particularly affected. Increasing income inequality is above the EU average.

Overall, Italy made some progress in addressing the 2016 country-specific recommendations. Substantial progress was made in reforming the budgetary process and ensuring that the spending review becomes an integral part of it. The reform remains to be fully implemented. Some progress was made to shift taxation away from productive factors and to implement civil justice reforms. In the banking sector, some progress was made with regard to improving corporate governance and the reform of the insolvency and debt collection framework. In the labour market, some progress was achieved regarding the implementation of the reform of active labour market policies and a reform to enhance anti-poverty measures and rationalise social spending. The full impact of these reforms may materialise only over time but early signs are positive. Despite this progress, the reform momentum has slowed down since mid-2016 and, in some key areas, reforms are still pending. In particular, limited progress was made in implementing the privatisation programme, reducing tax expenditures in number and scope, reforming the cadastral system and improving tax compliance. Similarly, limited progress was achieved in implementing the public administration reform, addressing non-performing loans in the banking sector, facilitating the take-up of work by second earners and addressing restrictions on competition. No progress was made regarding the reform of the statute of limitations and the adoption of the 2015 annual competition law.

Regarding progress in reaching the national targets under the Europe 2020 Strategy, Italy has already achieved its targets related to renewable energy, energy efficiency and early school leaving, and

appears on track to meet those on greenhouse gas emissions. Some progress was also made towards achieving the tertiary education target. Conversely, progress is less visible on the employment rate, R&D investment and poverty and social exclusion targets.

The main findings of the in-depth review contained in this country report, and the related policy challenges, are as follows:

- **Productivity growth remains weak, slowing the correction of Italy's macroeconomic imbalances.** Some steps were taken to improve the efficient allocation of resources in the economy. However, productivity developments remain sluggish, as total factor productivity is stagnant and investment has not yet recovered after the sharp fall recorded during the crisis.
- **High public debt remains a major source of vulnerability for Italy.** Public debt is forecast to broadly stabilise at around 133 % of GDP in 2016-2018. Despite a deteriorating structural primary surplus, refinancing risks seem limited in the short term thanks to the ECB's liquidity injection and Italy's improved external position. Medium-term sustainability risks are high as the structural primary surplus is forecast at only 1.3 % of GDP in 2018, based on a no-policy-change assumption. As a result, risks may emerge when the current accommodative monetary policy is phased out and interest rates start increasing, unless growth-friendly fiscal consolidation measures are adopted and bold structural reforms are implemented.
- **Despite recent gains, the competitiveness gap remains.** The depreciation of the euro supported the stabilisation of Italy's export performance in recent years, together with contained increases in producer prices and unit labour costs. However, sluggish labour productivity and the low-inflation environment make it more difficult to close the cost/price competitiveness gap vis-à-vis trade partners, in spite of continued wage moderation.
- **Non-performing loans hamper banks' ability to support investment.** Confidence in the Italian banking sector as a whole declined

considerably, in spite of significant bank-by-bank differences. Following rapid growth during the crisis, the sector's gross stock of non-performing loans stabilised only recently, at around EUR 329 billion (16.5 % of customer loans). The need for further loan-loss provisions, low interest rate margins and rather high operation costs put strain on banks' profitability and ability to raise fresh capital. Therefore, the Italian banking sector may face difficulties in meeting any future increase in credit demand. Financing conditions remain tight, particularly for small and medium-sized enterprises and the construction sector.

- **Despite the gradual improvement of the labour market, long-term and youth unemployment remain high.** The long-term unemployment rate was around 7 % in 2016. The youth unemployment rate is around 40 % and more than 1.2 million young people are not in education, employment or training. The implementation of the active labour market policies reform, including the reinforcement of public employment services, is still at an early stage. Firm-level bargaining is not broadly used, hampering the efficient allocation of resources and the responsiveness of wages to economic conditions.
- **Given its systemic importance, the Italian economy is a source of potential spillovers to the rest of the euro area.** At the same time, strong external demand from euro-area trade partners and a more supportive inflation environment are paramount to Italy's recovery, debt-to-GDP reduction efforts and recovering competitiveness.

Other key economic issues analysed in this report that point to particular challenges are as follows:

- **The crisis hit investment dynamics.** Investment in Italy suffered a sharper fall than in most Member States. The decline was broad-based, but particularly strong in non-residential investment and services. The recovery of investment is limited by the current weak demand, the general uncertainty surrounding the economy, reduced profit margins and still-tight financing conditions in particular for SMEs and some sectors. A stronger recovery,

including in foreign direct investment, is hampered by structural weaknesses, including inefficiencies in the public administration, justice system and business environment and the limited development of capital markets. Most of these barriers are targeted by ongoing reforms.

- **The potential of female labour market participation remains largely underutilised.** The employment rate of women is still 13.7 percentage points below the EU average. Access to affordable childcare remains limited with wide regional disparities, paternity leave is among the lowest in EU and the effectiveness of cash allowances for childcare has not been assessed. The tax system continues to discourage second earners from participating in the labour force.
- **Economic growth and efficiency are hindered by the tax system.** Despite a recent modest reduction, the tax burden on production factors remains among the highest in the EU. Low tax compliance and the complex tax code increase the burden on compliant firms and households, although measures were taken recently to tackle these problems. The long-awaited revisions of tax expenditures and cadastral values were further postponed.
- **Education reform is ongoing but tertiary education remains largely underfunded and participation in adult learning and apprenticeships is low.** The 2015 reform, if properly and swiftly implemented, is expected to improve school outcomes. In particular, strengthened apprenticeships and work-based learning aim to raise the labour-market relevance of education. However, participation in adult learning remains a persistent concern, in particular for those needing it most. In spite of recent partial measures, the higher education system suffers from significant underinvestment.
- **Italy's R&D and innovation performance is below EU average.** R&D investment in Italy, in particular by the private sector, continues to be considerably lower than the EU average. It is held back by a range of structural factors like the lack of high-skilled people, limited cooperation between academia and business and unfavourable framework conditions. Some new measures were introduced to strengthen Italy's innovation track record, notably the 'Industry 4.0' strategy.
- **New social policies have been put forward to respond to the rising poverty rate.** The rate of people at risk of poverty or social exclusion is well above the EU average, and is particularly high for children, temporary workers and individuals with a migrant background. To address poverty-related risks, the 2016 'Support for Active Inclusion' was extended to the whole territory and a draft law for the 'Inclusion Income' scheme was presented to Parliament and is to be adopted and implemented. It is unclear whether the financial resources will be sufficient to address Italy's poverty challenge. The 2016 peak inflow of asylum seekers is one of the highest in Europe and creates considerable social and budgetary challenges for the reception and integration of those receiving protection and for the reception and return of those not receiving protection, a comparatively large share.
- **Barriers to competition remain significant, and the business environment remains challenging.** Significant barriers to competition remain in important sectors, including professional services, local public services, concessions and the transport sector. Despite progress achieved in recent years, the conditions for doing business remain more difficult than in peer economies.
- **The public sector is being reformed to tackle longstanding inefficiencies.** The remaining inefficiencies continue to slow down the implementation of reforms, deter investment, and create opportunities for rent-seeking. An important reform of the public administration is being implemented. However, the Constitutional Court has recently declared unconstitutional the procedure envisaged for important implementing acts (including those on human resources management, state-owned enterprises and local public services). Improvements are expected in the field of public procurement thanks to the adoption of a

new code. Despite recent reforms of the civil justice system, the length of proceedings and the very high case backlog remain sizeable challenges. Corruption is still a major problem, and the statute of limitations and the fragmented prevention framework continue to hinder its reduction.

1. ECONOMIC SITUATION AND OUTLOOK

Real GDP growth, drivers and risks

Weak productivity dynamics largely explain slower GDP growth in Italy compared with the rest of the euro area. Over the period 2001-2015, Italy's average real GDP growth was zero, 1.2 percentage points below the average of the rest of the euro area. Low growth in total factor productivity (TFP) compared with euro area peers is the main factor explaining the observed lower growth rates (Graph 1.1). Italy's real GDP growth recovered only modestly in 2014 and 2015 (0.1 % and 0.7 % respectively), while growth in the rest of the euro area was significantly more dynamic (1.4 % and 2.3 % respectively). Total factor productivity growth turned slightly positive in Italy, possibly indicating a somewhat better allocation of factors of production, though still outpaced by the rest of the euro area. In addition, capital deepening developments were more negative in Italy as the net capital stock contracted due to the very low levels of investment.

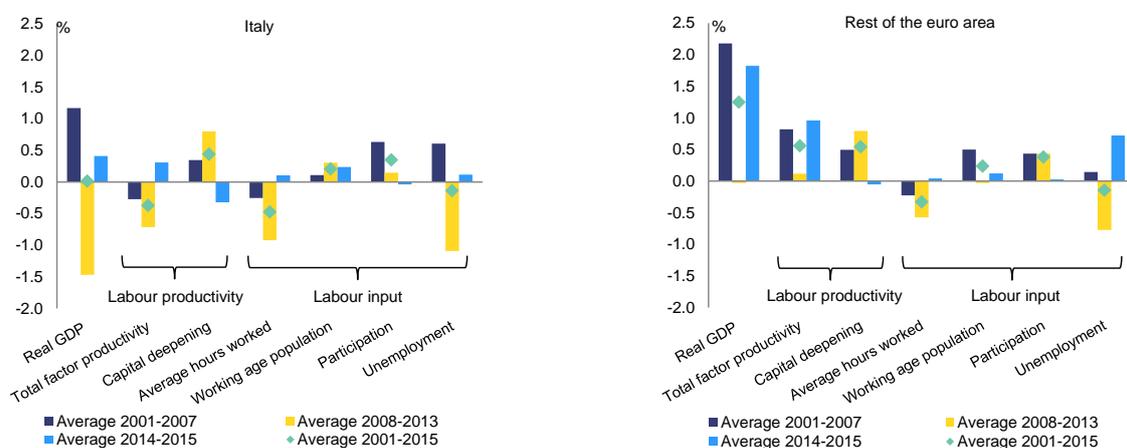

Potential output growth turned negative after 2008. The significantly lower capital accumulation, higher unemployment rates and negative TFP trends contributed to the decline in potential growth (-0.4 % on average in 2009-2016 from 1.1 % in 1999-2008; based on the Commission forecast and the commonly agreed methodology). Potential growth is estimated to turn slightly positive in 2017-2018.

A tepid recovery started in 2014. The gradual recovery of real GDP is supported by the ECB's

accommodative monetary policy and a more accommodative fiscal stance. The Commission forecast expects the Italian economy to have expanded by 0.9 % in 2016 (European Commission, 2017a). Exports, which drove the recovery in 2014-2015, slowed substantially in recent quarters, mainly due to the marked slowdown in extra-EU trade. Their contribution to the current recovery is thus more limited than in previous upswings and economic growth became more reliant on domestic demand developments. In particular, low energy prices and sustained employment growth underpin the increase in private consumption.

Looking ahead, the recovery is expected to remain modest. The Commission forecast projects the recovery to continue at a modest pace in 2017 and 2018, underpinned by an accommodative monetary policy and a still-supportive fiscal stance. However, following the rejection of the constitutional reform in a referendum on 4 December 2016, political uncertainty remains high. Moreover, in a challenging context of low nominal growth, low interest margins, regulatory changes, high non-performing loan (NPL) stocks and structurally low profitability (see Sections 3 and 4.2), Italian banks' credit supply could be held back, while credit demand is also still weak. Small and medium-sized enterprises (SMEs), which tend to be more reliant on bank credit, might thus be constrained in expanding their production capacity when demand prospects improve. All these aspects could thus hold back a stronger recovery in investment. Nevertheless, larger and healthier

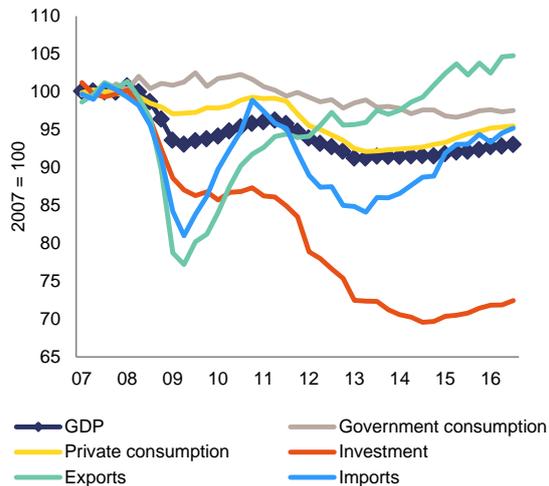

Graph 1.1: Growth accounting for Italy, by period

Source: European Commission

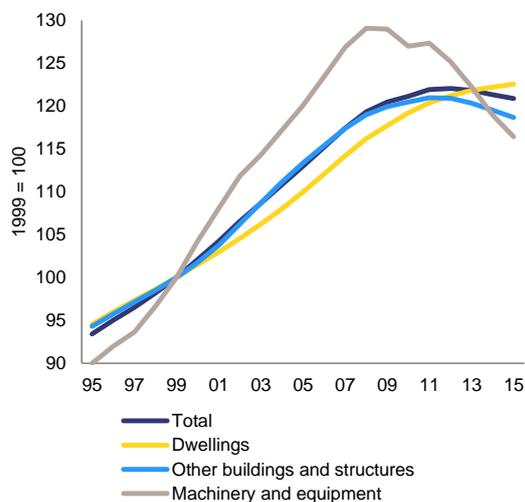

firms have better access to credit (see ‘Financing conditions’ in this section).

Graph 1.2: Real GDP and components

Source: European Commission

Graph 1.3: Net capital stock

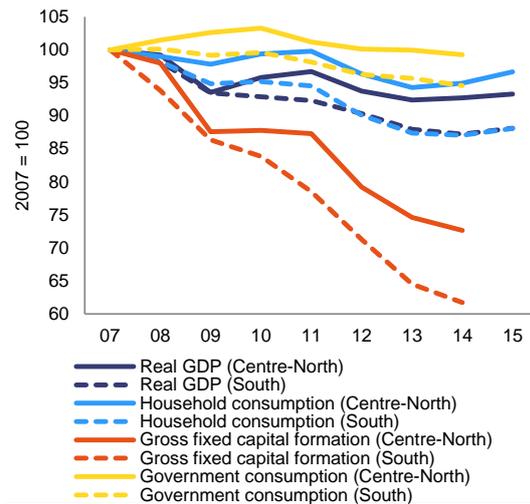

Source: Istat

Investment dynamics remain subdued. Overall sluggish demand, still tight financial conditions, in particular for small firms, and firms' reduced profitability hamper a faster recovery in investment (see Section 4.4). The current improvement in investment is driven mainly by equipment. However, investment remains nearly 30 percentage points below its pre-crisis level (Graph 1.2) and its growth is still too moderate to halt the ongoing depletion of the capital stock,

especially for machinery and equipment that undergo quicker amortisation and obsolescence (Graph 1.3).

Graph 1.4: Real GDP and domestic demand components at macro-regional level

Source: Istat

The crisis hit southern regions particularly hard and regional disparities persist on many fronts. Between 2007 and 2014, real GDP in southern regions fell by 1.9 % on average per year, whereas the decline in the centre-north was 1.1 % (Graph 1.4).⁽¹⁾ Investment in southern regions dropped by more than 6.5 % per year and in 2014 its level was around 38 % lower than in 2007 (as compared with -27 % in the centre-north). In 2015, the recovery in real GDP was slightly more dynamic in southern regions than in the centre-north (+1.1 % as against +0.6 %), despite household consumption increasing less. The tightening of financing conditions particularly affected firms in the south, leading to a more significant deterioration of loan quality. In Q2 2016, around 40 % of loans to firms in the south were non-performing, compared to less than 30 % in the centre-north. In 2015, compensation per employee in the south was 18 percentage points lower than in the centre-north, but the gap in labour productivity is even larger (23 percentage points). This reflects a long-term misalignment between wage and productivity dynamics in the

⁽¹⁾ The higher reliance of southern regions' economies on public expenditure persists. For instance, in 2014 public consumption amounted to around 32 % of GDP in the south as against 17 % in the centre-north.

south compared to the centre-north (European Commission, 2015a, p. 75). GDP-per-capita divergences are substantial due to lower labour market participation and the higher unemployment rate in the south (see ‘Labour market situation’ in this section). These developments point to a lack of resilience and adjustment capacity, particularly in southern regions.

Price and wage developments* (2)

Wage dynamics remain moderate. After slightly exceeding 1 % per year in 2014 and 2015, contractual wage growth slowed in 2016 (to around 0.5 %). Wages in the public sector have been frozen since 2011, but will increase slightly in 2017 following an agreement between the government and the unions. In the private sector, wage developments are expected to remain moderate in 2017 and 2018 following recent agreements in the metal and other sectors. These agreements provide for minor wage increases, *de facto* discounting the previous bargaining rounds which were based on excessively high inflation benchmarks. Actual wage developments continue to display a negative drift compared with contractual wage agreements, as the use of overtime and bonuses continue to be rather limited. (3) Furthermore, the tax incentives for new permanent hires in 2015 and 2016 curbed social contributions and thus overall compensation per hour worked (-0.4 % year-on-year in the first three quarters of 2016).

Unit labour cost dynamics slowed significantly in recent years despite negative labour productivity growth. Since 2010, nominal unit labour costs have slowed down in Italy and in 2014-2016 they increased by less than 0.4 % per year on average (as compared to 2.3 % in 1999-2013). These developments helped to reduce slightly the cost competitiveness problem of the Italian economy in recent years. In particular, the increase in compensation per hour worked is estimated to have fallen to only 0.2 % per year (from 2.6 % in 1999-2013) thanks to moderate wage developments after the double-dip recession and 3-year tax incentives for new permanent hires

in 2015 and 2016. However, labour productivity was negative also due to historically low investment levels, which turned capital deepening negative (see Section 4.4). On top of persistently sluggish productivity, the adjustment process of the Italian economy is hindered by the low inflation environment, which makes it more difficult to recover cost and price competitiveness vis-à-vis trade partners. In the euro area in particular, nominal unit labour costs rose by only 0.6 % per year in 2014-2016 (as against 1.6 % in 1999-2013), as after the crisis the slowdown in labour productivity was more than offset by the marked slowdown in compensation per hour worked (to around 1 % per year, from 2.7 % in 1999-2013).

Moderate unit labour costs developments and sluggish demand point to subdued core inflation and GDP deflator growth. In 2016, headline HICP (4) inflation was close to zero for the third year in a row (i.e. -0.1 % in 2016, following +0.1 % and +0.2 % in 2015 and 2014 respectively). HICP core inflation (i.e. excluding energy and unprocessed food) remained slightly positive (+0.5 % in 2016, following +0.7 % in both 2014 and 2015). Higher energy prices are expected to lead to higher HICP inflation in 2017 and 2018 1.4 % and 1.3 % respectively in the Commission forecast, whereas core inflation is set to stay at around 1 % on average). The GDP deflator (5) showed a marked slowdown since 2010, driven by moderate increases in nominal unit labour costs (0.5 % on average in 2010-2015) and lower firm profit margins following the crisis (Graph 1.5) due to the overall sluggish demand. In 2016-2018, the Commission forecast projects the GDP deflator to average around 1 % thanks to still-slow unit labour costs developments (0.7 % on average) and lower taxes on production, while firms restore profit margins. (6)

(4) Harmonised Index of Consumer Prices

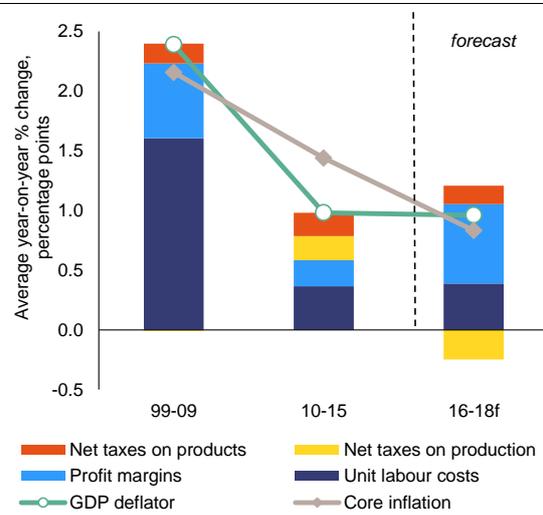

(5) The GDP deflator only includes prices of goods and services produced in the country.

(6) In 2010-2015, the increasing impact on the GDP deflator of higher taxes on production was due mainly to higher property taxes. The decreasing impact of lower taxes on production expected in 2016-2018 is explained mainly by the reduction in labour costs through the exemption of permanent employment costs from the tax base of the regional tax on economic activities (*IRAP*).

(2) An asterisk indicates that the analysis in the section contributes to the in-depth review under the MIP.

(3) Actual hourly wages increased by around 0.5 % in 2014-2015 and only 0.1 % in the first three quarters of 2016.

Graph 1.5: GDP deflator growth and contributions

Notes: The contribution of unit labour costs includes imputed compensations of self-employed. Taxes on production and products are net of subsidies

Source: European Commission

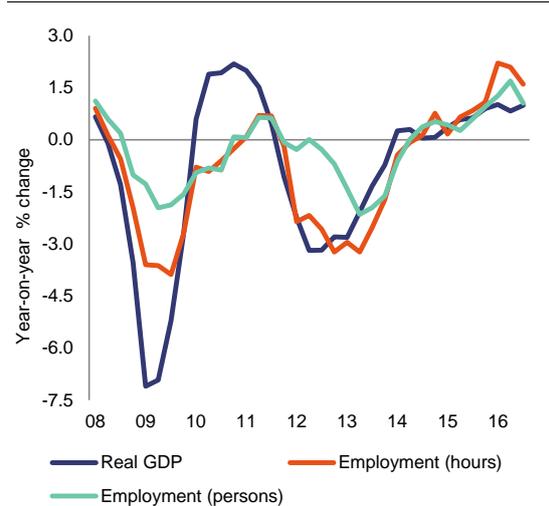

Labour market situation*

Labour market conditions are improving, supported by reforms and the reduction in the labour tax wedge. Employment growth started to recover in 2014 when the economy was still stagnating, and this trend continued in 2015 and 2016. The number of employed people in the fourth quarter of 2016 was over 620 000 higher than the trough in the third quarter of 2013. The number of employees increased even more, by around 680 000, of which 405 000 had permanent contracts. In addition, the use of *Cassa Integrazione Guadagni* schemes notably fell by around 64.5 % in three years. The number of worked hours peaked at more than 10.7 million in the third quarter of 2016, the highest value since the second quarter of 2012.

Employment growth has slightly outpaced real GDP growth in recent years. The higher elasticity of employment to GDP could be explained by tax incentives and other factors. In particular, following the crisis, when hours worked fell more than headcount employment (Graph 1.6), the share of part-time employment (including involuntary) has increased. These developments have yet to be reversed, so hours worked per employed person, while recovering, are still below the pre-crisis level. Furthermore, there might have been some substitution between labour and capital

as factors of production. On the one hand, recent labour market reforms, wage moderation and the reduced tax wedge facilitated the use of labour, while on the other hand, tight financing conditions may have delayed gross fixed capital formation.

Graph 1.6: Real GDP and employment growth

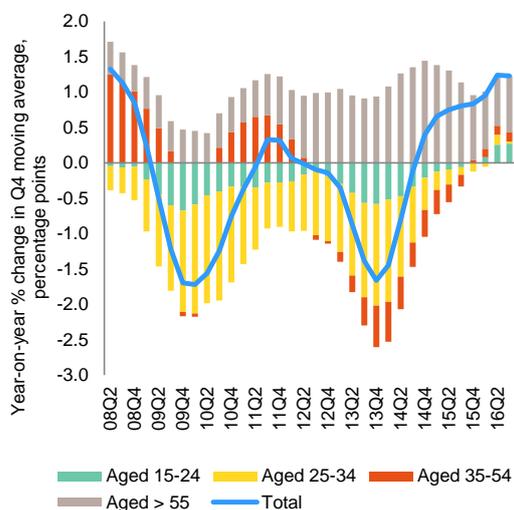

Source: European Commission

Employment is increasing in private services, manufacturing and agriculture. Since mid-2014, employment has increased in private services and agriculture, while the recovery in manufacturing started mid-2015. In contrast, the construction sector still experiences large negative employment readings as the adjustment to lower production levels is still ongoing. Finally, after declining by almost 9 % over 2007-2015, public sector employment has broadly stabilised. In the first three quarters of 2016, overall employment (in persons, according to the national accounts definition) rose by 1.3 % year-on-year, with the positive contributions coming from private services (+2.4 %), manufacturing (+1.3 %) and agriculture (+4.2 %). In the same period, employment in construction continued to fall significantly (-4.5 %), while it declined marginally in public services (-0.1 %). Furthermore, also linked to the labour market reforms, employment increased only for employees (+2.0 %), while self-employment continued to shrink (-0.5 %).

Employment is improving in all age groups. The large fall in employment observed during the double-dip recession was particularly marked for the younger cohorts (Graph 1.7). In contrast, the

long-term trend of rising employment for people aged over 55 continued during the crisis, also thanks to reforms needed to keep the public pension system sustainable (see Section 4.1). Total employment growth turned positive in the second half of 2014, and since mid-2015 employment has grown in all age groups. However, the current economic recovery is not strong enough to allow a swift absorption of the sizeable unemployment of young people. This might have permanent negative effects on Italy's growth prospects (see Section 3).

Graph 1.7: **Employment developments and contributions by age group**

Source: European Commission

The unemployment rate remains high, in particular in southern regions. After peaking at more than 12.5 % in 2014, the Italian unemployment rate averaged 11.7 % in 2016, as higher employment is matched by higher labour market participation (i.e. the activity rate increased). The unemployment rate remains particularly high in the south, where it stood at around 19 % in Q3 2016 (as against just above 7.5 % and 10.5 % in northern and central regions respectively).⁽⁷⁾ The Commission forecast projects a mild decline in the unemployment rate in 2017 and 2018 due to a slowdown in employment growth as the impact of tax incentives fades out, while labour market participation (i.e. the activity rate) is expected to increase further.

⁽⁷⁾ Furthermore, in the third quarter of 2016, the activity rate of the population aged 15-64 was around 54 % in the south as against more than 70 % in the centre-north (41 % and 62 % respectively for women).

Social situation: poverty and inequality

The share of the population at-risk-of-poverty-or-social-exclusion (AROPE) stabilised close to 29 % in 2015, one of the highest rates in the EU. Children are particularly affected, with an AROPE rate of around 33.5 %, as against 26.5 % in the EU as a whole. Poverty rates are also much higher among people with a migrant background than among the native-born (around 48 % as against 26 %). In addition, there are substantial regional disparities, with very large differences in AROPE rates between northern and southern regions. In-work poverty is also high, exacerbated by a still highly segmented labour market (see Section 4.3).

Income inequality had been growing since 2008 and stabilised slightly above the EU average. Based on 2015 data, the ratio of total income received by the richest 20 % to total income received by the poorest 20 % was 5.8 (EU average: 5.2). The ratio grew by 12 % from 2008 to 2015. This negative development is more related to slow income growth among poorer households than to fast growth among wealthier ones.⁽⁸⁾ The large share of pension expenditure hampers the effectiveness of social transfers in reducing inequalities. However, when including taxation, the overall impact of public intervention to curb inequalities remains close to the EU average. Moreover, the fragmentation of the system makes it more difficult to arrive at a comprehensive assessment of the impact of taxes and benefits (European Commission, 2016a; Figari and Fiorio, 2015).

Inequality based on the distribution of net wealth⁽⁹⁾ is within the range observed in other EU countries for which data were collected in 2013-2014 (ECB 2016). Nevertheless average net wealth per household fell in Italy between 2010 and 2014 (to EUR 226 000 from EUR 275 000), mainly due to the fall in house prices.

The inflow of people entering the country as irregular migrants, including people seeking asylum, accelerated. In 2016, around 181 000

⁽⁸⁾ Standing at 0.86 on the basis of 2015 data, the 'S90/S50' indicator, which picks up inequality at the higher end of the income distribution, was only slightly higher than the EU average, while the 'S50/S10' indicator, which picks up inequality at the bottom end, stood at 13.33 (the fourth highest in the EU).

⁽⁹⁾ Difference between total assets and total liabilities.

irregular migrants were detected on the Central Mediterranean route, an all-time high and nearly a fifth more than in the same period of 2015. In 2016, about 123 000 asylum applications were recorded in Italy, an increase by 47% compared to 2015. According to available estimates, a relatively large share of the inflow is from countries with relatively low asylum recognition rates. The inflow is among the highest in the EU in absolute terms and creates marked budgetary and social challenges for the reception and integration of those receiving international protection.

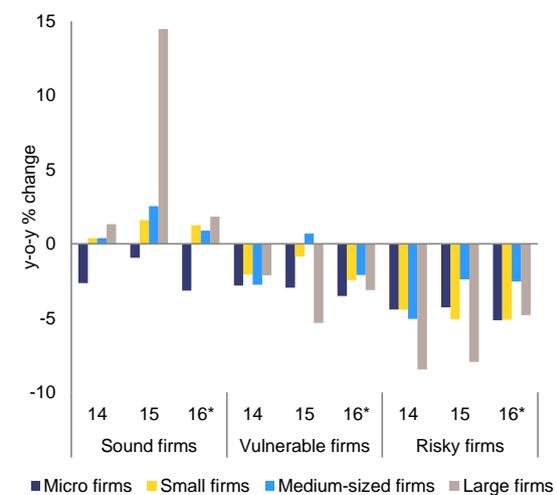

Financing conditions*

The significant decrease in the nominal cost of lending is not accompanied by a recovery of bank credit. Driven by the ECB's expansionary monetary policy, which led to a strong decrease in nominal interest rates, rates for new loans to households for house purchase and to firms reached historically low levels in November 2016 (2.05 % and 1.56 % respectively). However, so far there is no broad-based recovery of the stock of bank credit. While lending to households has increased by around 1.5 % year-on-year in recent months, corporate lending is not recovering yet.

The deterioration in asset quality has led to more conservative stance towards new lending, especially for small firms. The weak lending to firms appears to be driven by both demand and supply factors. Survey data suggest that low credit demand is mainly explained by the tepid and uncertain economic outlook. However, other factors contribute to this trend, i.e. large firms' increased self-financing capacity, higher profit margins and higher reliance on capital market funding (supported by regulatory incentives and the ECB's Corporate Sector Purchase Programme as of June 2016), as well as remaining deleveraging needs in the corporate sector. On the credit supply side, banks' large stock of non-performing loans (see Sections 3 and 4.2) may *inter alia* have led to more conservative lending standards for corporates. This has mainly weighed on the growth of bank credit to vulnerable and risky firms – especially when they are small – but also to micro-firms, including low-risk ones (Graph 1.8). Creditworthy medium-sized and large firms however – often active internationally – are able to benefit from increased price competition between banks, contributing to the

compression of banks' net interest margins. While prudent lending policies may limit the emergence of new problem loans in the future, they could become a drag on Italy's economic recovery, especially when credit demand picks up. Meanwhile, alternative non-bank funding options remain relatively underdeveloped in Italy (European Commission, 2016b).

Graph 1.8: Bank credit to firms by firm size and risk profile

Notes: * refers to the period June 2015 - June 2016 (preliminary data for June 2016). A firm's risk profile is based on its estimated one-year probability of default according to several balance-sheet indicators. The sample consists of ca. 400 000 firms.

External position*

Italy's current account surplus is approaching 3 % of GDP. An improved export performance coupled with slow nominal import dynamics led to a steady increase in the current account balance. Starting from a deficit position of -3.4 % of GDP in 2010, the current account turned positive in 2013 and reached a surplus position of 2.7 % of GDP in the 12-month period up to November, i.e. an increase of more than 6 percentage points of GDP. The trade balance surplus rose to 3.5 % of GDP (from -1.9 % in 2010), owing to lower oil prices but also the sharp fall in domestic demand, especially investment (see Section 4.4). Increases were also recorded in the primary income balance, which recently turned marginally positive, *inter alia* thanks to lower interest rates paid on domestic debt held by foreign investors.

From a savings-investment perspective, the current account surplus reflects a deleveraging process. Between 2010 and 2016, gross capital formation as a share of GDP fell by 3.8 percentage points, while savings increased by 2.4 percentage points. The position of the corporate sector turned from net borrower of into net lender to the economy, as firms' savings have increased by around 1.5 percentage points of GDP since 2010, while their investment fell by 1.4 percentage points. Furthermore, the share of investment accounted for by the government and the household sectors fell (by -0.7 and -1.7 percentage points of GDP respectively), while the government sector also increased its savings (by 1.2 percentage points of GDP).

Estimates of the cyclically adjusted current account balance show a surplus in the order of 2.5 % of GDP in 2016. ⁽¹⁰⁾ By contrast, a current-account deficit of around 0.5 % of GDP might be sufficient to stabilise Italy's net international investment position over the next 10 years (assuming zero valuation effects).

Italy's net international investment position remains slightly negative. Over the last two years, Italy's negative net financial position vis-à-vis the rest of the world oscillated around -20 % of GDP (European Commission 2015a; European Commission, 2016b). Direct investment and equity portfolio investment both display a positive net position (around +7 % and +28 % of GDP respectively at the end of Q2 2016). In contrast, the net position in debt securities is significantly negative (around -37.5 % of GDP), mainly due to foreign investors' exposure to Italian sovereign debt. Finally, the Bank of Italy has a net negative financial position towards the Eurosystem (see Section 3).

Public finances: public deficit and debt*

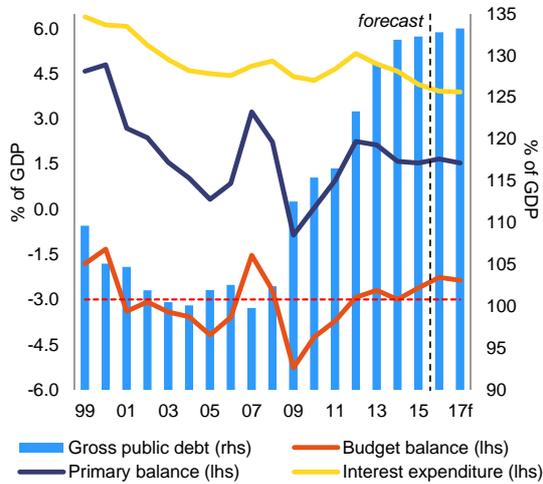

The headline government deficit broadly stabilised thanks to lower interest expenditure and improving cyclical conditions. Since 2012 the government deficit has been slightly below 3 % of GDP and is estimated to have declined to 2.3 % in 2016 after 2.6 % in 2015 (Graph 1.9). Thanks to

the ECB's accommodative monetary policy stance, interest expenditure declined steadily (from the recent peak of 5.2 % of GDP in 2012 to 3.9 % in 2016). At the same time, the primary surplus fell from 2.3 % of GDP in 2012 to 1.6 % in 2014 and has broadly stabilised since then, despite better cyclical conditions. As a result, the structural primary balance is estimated to have worsened significantly (from 3.9 % of GDP in 2013 to 2.3 % in 2016), while the structural balance is estimated to have deteriorated by 0.7 percentage points of GDP in 2016 compared to 2015. The Commission forecast projects that the fiscal stance would be relaxed further in 2017 as the primary balance and the headline deficit are set to worsen slightly in spite of real GDP growth of 0.9 % (as against potential growth estimated at 0.1 %). In 2017, the deficit will be affected by the impact of recent earthquakes. One-off emergency and reconstruction measures for new earthquakes will add up to those already earmarked for previous earthquakes in Abruzzi (2009) and Emilia Romagna (2012). Moreover, in 2017 the Commission will consider eligible for the 'unusual event clause' the 0.18 % of GDP earmarked by the government for its 'preventive investment plan for the protection of the national territory against seismic risks'.

Gross public debt as a share of GDP is stabilising at a very high level. The public debt-to-GDP ratio is expected to have increased to 132.8 % in 2016. Privatisation proceeds, at less than 0.1% of GDP, fell short of the 0.5 % planned by the government a year before and the Treasury increased its liquidity buffer. In 2017, the debt is expected to be slightly higher than in 2016, partly due to support to the banking sector for which EUR 20 billion (or 1.2 % of GDP) has been earmarked (see Section 4.2).

⁽¹⁰⁾ For the methodology to eliminate the cyclical component from the current account balance, see Salto and Turrini, 2010.

Graph 1.9: Italian public finance indicators

Source: European Commission

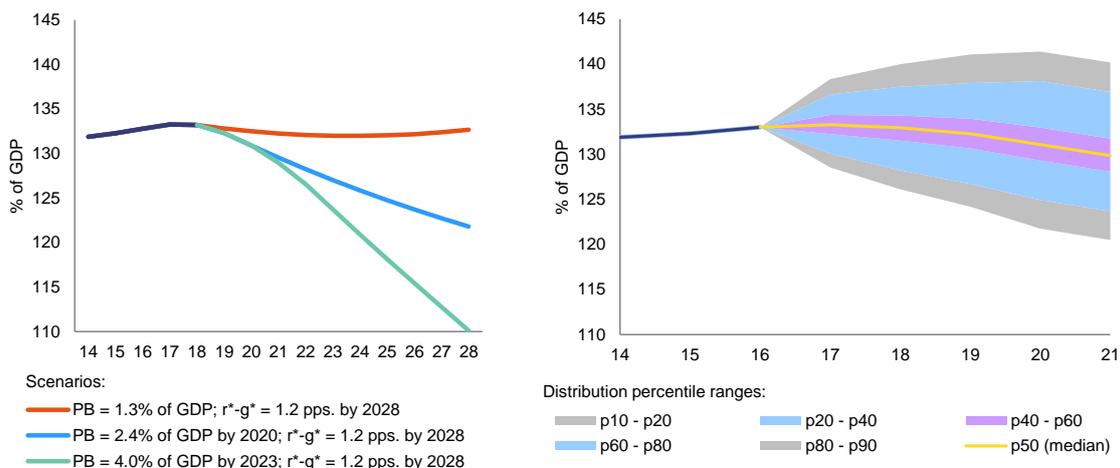

growth-rate differential assumption, the DSA shows that a primary surplus gradually increasing to 2.4 % of GDP (i.e. the average recorded in the pre-crisis period) would lead to an only moderately declining debt-to-GDP ratio over 10 years. ⁽¹¹⁾ By contrast, gradually going back to a primary surplus in the order of 4 % of GDP would allow putting the debt ratio on a more ambitious declining path. A reinforced sensitivity analysis, based on a stochastic DSA exercise (Berti, 2013) where over a period of five years (2017-2021) (random) shocks are applied to the primary balance, interest rates and GDP growth based on historical behaviour, shows that Italy's public debt ratio could increase further in the medium term if the fiscal position (i.e. the projected structural primary surplus) is not strengthened (Graph 1.10, right-hand side).

Debt sustainability analyses (DSAs) point to the risk of still very high debt in the medium term.

A simple (deterministic) DSA exercise run over 10 years (Graph 1.10, left-hand side) shows that if the 1.3 % of GDP structural primary surplus forecast for 2018 were kept constant and the interest-rate-growth-rate differential gradually converged towards the pre-crisis (1999-2007) average of 1.2 percentage points (from the 0.6 percentage point trough forecast in 2018), the debt-to-GDP ratio would remain above 130 % of GDP in the medium term. Under the same interest-rate-

⁽¹¹⁾ In the rest of the euro area, the interest-rate-growth-rate differential was around 0.5 percentage points in 1999-2007.

Graph 1.10: Evolution of Italy's public debt-to-GDP ratio under different debt sustainability analyses

Notes: The left-hand side panel shows the results of a 10-year deterministic DSA starting from 2019 ('PB' = primary balance; 'r*-g*' = interest-rate-growth-rate differential). The right-hand side panel shows the results of a 5-year stochastic DSA starting from 2017. The 'p10_p90' cone covers 80 % of all possible debt paths obtained by simulating random shocks. The lower and upper lines delimiting the cone represent the 10th and the 90th distribution percentiles respectively, thus excluding from the shaded area simulated debt paths that result from more extreme shocks, or 'tail events' (20 % of the whole). For more details: European Commission, 2016c; Berti, 2013.

2. PROGRESS WITH COUNTRY-SPECIFIC RECOMMENDATIONS

Progress with the implementation of the recommendations addressed to Italy in 2016⁽¹²⁾ has to be seen in a longer term perspective, since the introduction of the European Semester in 2011.

In the area of public finances, restraints on healthcare spending and the public wage bill introduced since 2011 have helped to contain public expenditure over time. In 2012, a pension reform, now partly reverted (see Section 4.1), helped to improve long-term debt sustainability, while maintaining the adequacy of pensions. Some privatisations contributed to a slight reduction of public debt. Important taxation reforms have been taken since 2011, albeit sometimes inconsistently. For instance, the tax on immovable property was increased in 2011, but partly repealed in 2015. Measures to reduce the tax burden on labour were taken in 2014 and 2015, partly financed by shifting taxation to consumption. In 2014, important tax simplification measures were undertaken.

In civil justice, a major reorganisation of civil courts was completed in 2013, and several measures were introduced to reform civil procedures, strengthen out-of-court settlement and reduce abusive litigation. A comprehensive anti-corruption law was adopted in 2012 to step up the fight against corruption. The law established an anticorruption agency, which was reinforced in 2014, but still lacks adequate resources. A crucial reform of the statute of limitations has been repeatedly delayed. In public administration, measures to improve staff mobility and promote digital technology were introduced in 2014.

In the banking sector, several corporate governance reforms have been adopted since early 2015 and are now implemented. Measures were also taken to help banks dispose of their impaired loans. These measures (e.g. a more favourable tax treatment of loan loss provisioning, insolvency and collateral enforcement reforms and an impaired loan securitisation mechanism benefitting from state guarantees) are aimed mainly at supporting

the development of a private secondary market for distressed assets in Italy. Finally, since 2012, the authorities have passed several measures to support and diversify firms' access to finance, notably through an allowance for corporate equity (now partially reversed), mini-bonds and the central guarantee fund for small- and medium-sized enterprises.

A wide-ranging reform of the labour market ('Jobs Act') was initiated at the end of 2014. *Inter alia*, the reform reduced the cost and the uncertainty related to individual dismissals and rationalised contractual forms and policies. It also foresaw a reform of active labour market policies, which is now being implemented. The 2014 reform built on and followed the lines of a previous labour market reform undertaken in 2012. A reform of the collective bargaining framework has long been discussed, and social partners signed important agreements on the representativeness of trade unions in 2014. However, progress has been limited to date, while new sector-by-sector agreements are being reached. The 2012 pension reform increased the labour market participation of the elderly. However, the recent backtracking on it reinforces the unbalanced composition of social expenditure in favour of pensions (see Section 4.3.2). An important education reform was undertaken in 2015 ('La Buona Scuola') and is now being implemented. To alleviate poverty risks, several experimental measures have been introduced since 2012.

In-depth market opening measures for regulated professions and some measures for the retail sector were introduced in 2012. Since 2011, several packages have been adopted to reduce the administrative burden for companies and citizens.

Overall, Italy made some progress in addressing the 2016 country-specific recommendations.⁽¹³⁾ Substantial progress was made in reforming the budgetary process. Some

⁽¹²⁾ For the assessment of other reforms implemented in the past, see in particular Section 4.

⁽¹³⁾ Information on the progress and action take to address the policy advice in each respective subpart of a country-specific recommendation is presented in the overview table in Annex A. This overall assessment does not include an assessment of Stability and Growth Pact compliance.

progress was made with regard to civil justice, labour market and the banking sector. Conversely, progress was limited on taxation, competition and public administration, and no progress was made in reforming the statute of limitations.

Table 2.1: Summary table on 2016 CSR assessment

Italy	Overall assessment of progress with 2016 CSRs: Some progress
<p>CSR 1: <i>In 2016, limit the temporary deviation from the required 0.5 % of GDP adjustment towards the medium-term budgetary objective to the amount of 0.75 % of GDP allowed for investments and the implementation of structural reforms, subject to the condition of resuming the adjustment path towards the medium-term budgetary objective in 2017. Achieve an annual fiscal adjustment of 0.6 % or more of GDP towards the medium-term budgetary objective in 2017. Finalise the reform of the budgetary process in the course of 2016 and ensure that the spending review is an integral part of it. Ensure the timely implementation of the privatisation programme and use the windfall gains to accelerate the reduction of the general government debt ratio. Shift the tax burden from productive factors onto consumption and property. Reduce the number and scope of tax expenditures and complete the reform of the cadastral system by mid-2017. Take measures to improve tax compliance, including through electronic invoicing and payments.</i></p> <p>(MIP relevant)</p>	<p>Some progress</p> <ul style="list-style-type: none"> • Substantial progress in reforming the budgetary process and ensuring that the spending review becomes an integral part of it • Limited progress in implementing the privatisation programme • Some progress in shifting taxation away from productive factors • Limited progress in revising tax expenditure and in reforming the cadastral system • Limited progress in improving tax compliance
<p>CSR 2: <i>Implement the reform of the public administration by adopting and implementing all necessary legislative decrees, in particular those reforming publicly-owned enterprises, local public services and the management of human resources. Step up the fight against corruption including by revising the statute of limitations by the end of 2016. Reduce the length of civil justice proceedings by enforcing reforms and through effective case-management.</i></p> <p>(MIP relevant)</p>	<p>Limited progress</p> <ul style="list-style-type: none"> • Limited progress in implementing the public administration reform • No progress in revising the statute of limitations • Some progress in enforcing civil justice reforms, although the length of proceeding is not decreasing
<p>CSR 3: <i>Accelerate the reduction in the stock of non-performing loans, including by further improving the framework for insolvency and debt collection. Swiftly complete the implementation of ongoing corporate governance reforms in the banking sector.</i></p> <p>(MIP relevant)</p>	<p>Some progress</p> <ul style="list-style-type: none"> • Limited progress in addressing non-performing loans • Some progress in improving the framework for insolvency and debt collection • Some progress in implementing corporate governance reforms

Source: European Commission

Box 2.1: Contribution of the EU budget to structural change in Italy

Italy is the second beneficiary of the European Structural and Investment Funds (ESIF) and will receive up to EUR 42.7 billion by 2020. This is equivalent to around 0.4 % of GDP annually (over 2014-2017) and 10 % of public investment ⁽¹⁾. Of the EU financing, EUR 1 860 million is planned to be delivered via financial instruments. By 31 December 2016, an estimated EUR 10.8 billion, which represents about 25 % of the total allocation for ESI Funds, have already been allocated to concrete projects.

Financing under the European Fund for Strategic Investments, Horizon 2020, the Connecting Europe Facility and other directly managed EU funds is additional to the ESI Funds. By end-2016, Italy signed agreements for EUR 1.3 billion for projects under the Connecting Europe Facility. The EIB Group approved financing under EFSI amounts to EUR 4.3 billion, which is expected to trigger nearly EUR 28.7 billion in total investments (as of end-2016).

ESI Funds helped progress on a number of structural reforms in 2015 and 2016 via *ex-ante* conditionalities ⁽²⁾ and targeted investment. Examples include the adoption of the first national broadband and Digital Agenda strategies and the implementation of a national strategic policy framework for poverty reduction. An important contribution was also made on State aid and public procurement by addressing the deficiencies in the cross-regional application of EU State aid rules and by overcoming the difficulties in the transposition of the public procurement *acquis*. These reforms have prepared the ground for better implementation of public investment projects in general, including those financed from national sources and from the other EU instruments. The fulfilment of *ex-ante* conditionalities is on track. In addition to that, administrative reforms support is available through targeted financing under the European Social Fund, advice from the Structural Reform Support Service and, indirectly, through technical assistance.

The relevant country-specific recommendations (CSRs) focusing on structural issues were taken into account when designing the 2014-2020 programmes. These included: improving the business environment, particularly by contributing to the acceleration of the implementation of the Small Business Act and the facilitation of small and medium-sized firms' access to finance; supporting the reform of the public administration by enhancing the institutional capacity of public authorities; the setting up of a national system of ports and logistics; sustaining the national anti-poverty strategy through effective social services and active inclusion measures and the implementation of the school reform. Italy has also received support from the Youth Employment Initiative to implement the Youth Guarantee which acted as a driver of structural reforms in the labour market. To date, and according to the latest monitoring of the Youth Employment Initiative, almost 800 000 young people have benefited from it and around 110 000 young people are in employment, education or training after the Youth Employment Initiative support ended. The European Social Fund also contributes to the implementation of the reform of active labour market policies (ALMP) by strengthening public employment services and supporting the strategic plan on active labour market policies (*Piano per le Politiche Attive*) (see Section 4.3).

ESI Funds address wider structural obstacles to growth and competitiveness to overcome the longstanding socio-economic divide between the north and south of Italy, in addition to the challenges specifically identified in past country-specific recommendations. These include: improving the coverage of fast broadband (100 % of households by 2023); addressing bottlenecks in transport infrastructure (270 km of reconstructed railroads by 2023); supporting overall 101 000 enterprises mainly via financial instruments; incentivising innovation and private investments (2020 target of 1.53 % of R&D expenditure in relation to GDP); reducing primary energy consumption of 20 %.

<https://cohesiondata.ec.europa.eu/countries/IT>

⁽¹⁾ National public investment is defined as gross capital formation + investment grants + national expenditure on agriculture and fisheries.

⁽²⁾ Before programmes are adopted, Member States are required to comply with a number of *ex-ante* conditionalities, which aim at improving framework and conditions for the majority of public investments areas. For Member States that did not fulfil all the *ex-ante* conditionalities by the end of 2016, the Commission has the possibility to propose the temporary suspension of all or part of interim payments.

3. SUMMARY OF THE MAIN FINDINGS FROM THE MIP IN-DEPTH REVIEW

The in-depth review, which the 2017 AMR concluded should be undertaken for the Italian economy, is presented in this report (European Commission, 2016d). In spring 2016, Italy was identified as having excessive macroeconomic imbalances relating to its high public debt and weak external competitiveness in a context of weak productivity growth, as well as adjustment issues linked to the high level of non-performing loans on banks' balance sheets, the still high level of unemployment and significant increases in the long-term and youth unemployment rates. For these reasons, a new in-depth review is needed to assess how these imbalances evolved.

Analyses integrated in this country report provide an in-depth review of how the imbalances identified have developed. In particular, analyses relevant for the in-depth review can be found in this section, Section 1 and the entire Section 4. ⁽¹⁴⁾

Imbalances and their gravity

Structural shortcomings are at the root of Italy's macroeconomic imbalances. The more negative performance of the Italian economy relative to the rest of the euro area, in particular in terms of productivity, is largely explained by its structural weaknesses. The production structure has not evolved and adapted sufficiently to the heightened global competition and technological innovation characterising the last two decades (Pinelli et al., 2016; Calligaris et al., 2016). Furthermore, banks are currently burdened by a large stock of non-performing loans (NPLs) following the protracted crisis and might not be able to support fully an efficient allocation of resources. Finally, the high levels of long-term and youth unemployment also weigh on future economic growth prospects.

The high public debt-to-GDP ratio remains a major macroeconomic imbalance for the Italian economy. The level of public debt, at more than 130 % of GDP, means that significant resources are earmarked to cover debt servicing costs, to the detriment of more growth-enhancing items

including education, innovation, infrastructure and a lower tax burden on factors of production. Moreover, the high public debt is coupled with low productivity growth, suggesting a weak capacity to equip the country with productivity-enhancing physical and digital infrastructure, up-to-date skills in the labour force and effective institutions. High public debt and low growth prospects limit the possibility of using fiscal automatic stabilisers in the event of negative economic shocks. The high public debt also makes the country vulnerable to financial market volatility in periods of increased risk aversion, with higher interest rates for the government that could in turn tighten financing conditions for the real economy. Italy experienced this vicious circle during the 2011-2012 sovereign debt crisis, when private investment collapsed.

Non-cost competitiveness factors continue to weigh on Italy's external competitiveness. Italy's production structure remains biased towards medium- and low-tech industries. The share of high-tech exports has increased only slightly (from the recent trough of around 8 % in 2008 to around 10 % in 2015). Consistently, Italy's revealed competitive advantage continues to be concentrated in traditional sectors such as textiles, footwear, leather and metal products (for goods) and tourism (for services).

The high level of non-performing loans (NPLs) hampers banks' support for investment growth. The protracted recession has burdened Italian banks with a systemic and historically high level of non-performing loans that stabilised only recently. In the third quarter of 2016, gross NPLs amounted to EUR 329 billion (or 16.5 % of total customer loans). Gross bad loans – NPLs with the worst recovery prospects – amounted to EUR 198 billion (net of loan-loss provisions, bad loans stood at EUR 85 billion). The NPL problem weighs on banks' profitability and on the recovery of credit, thereby constituting a drag on investment (see Sections 1 and 4.2). Under these conditions, banks may find it challenging to support any future increase in (the still-depressed) credit demand. Meanwhile, credit conditions remain particularly tight for small and medium enterprises and the construction sector.

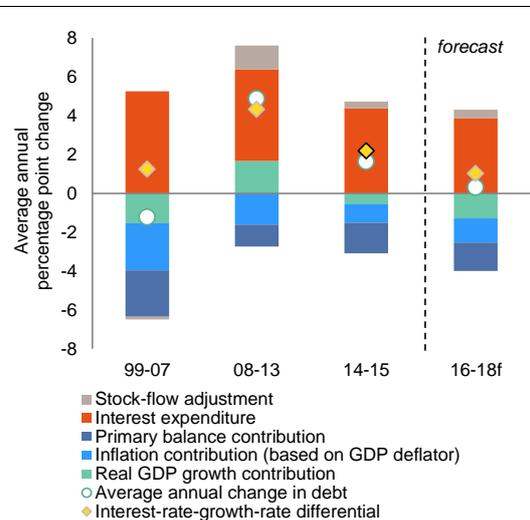

⁽¹⁴⁾ An asterisk indicates that the analysis in the section contributes to the in-depth review under the MIP.

The protracted recession and the subsequent slow recovery have resulted in high unemployment – particularly for young people – affecting social cohesion and possibly entailing permanent effects on growth. The unemployment rate was still 12 % in December 2016 (broadly unchanged compared to 2015, and against 9.6 % in the euro area), of which around 7 percentage points were unemployed for at least 12 months. Moreover, after averaging around 40 % in 2015, the youth unemployment rate (aged 15-24) was still above 40 % in December 2016 (around 21 % in the euro area). Finally, in Q3 2016 young people aged 15-24 who were not in education, employment or training still numbered over 1.2 million (or 20.9 %, i.e. one of the highest shares in the EU), albeit around 100 000 fewer than a year before (see Sections 1 and 4.3).

Evolution, prospects, and policy responses

The public debt is forecast to stabilise at around 133 % of GDP in 2016-2018. After rising by around five percentage points per year on average during the double-dip recession of 2008-2013, Italy's government debt-to-GDP ratio continued to increase, but at a significantly slower pace (1.6 percentage points on average) in 2014-2015 (Graph 3.1). In 2016-2018, a broad stabilisation of the debt ratio is forecast, mainly thanks to the ECB's accommodative monetary policy which decisively contributes to reducing the differential between the average interest rate paid on debt and the GDP growth rate. The ECB's action, and in particular its Public Sector Purchase Programme, helped to curb the average interest rate paid on the debt as new issuances of Italian government securities benefited from historically low nominal interest rates in 2016 (0.55 % on average, from 0.7 % in 2015 and 1.35 % in 2014). Low interest rates have in turn supported the GDP growth rate by underpinning a gradual economic recovery, while limiting the risk of outright deflation. As a result, the interest-rate-growth-rate differential is expected to go below the levels recorded before the crisis, and the Commission forecast projects a stabilisation of the debt-to-GDP ratio.

Graph 3.1: Drivers of change in Italy's public debt-to-GDP ratio

Notes: The interest rate/growth rate differential is the driver of the 'snowball effect' on the debt-to-GDP ratio. The snowball effect includes the debt-increasing impact of interest expenditure and the debt-decreasing impact resulting from the growth of the denominator (i.e. real GDP growth plus inflation).

Source: European Commission

A weak fiscal position, together with modest growth prospects, makes Italy vulnerable to increases in risk aversion on financial markets.

Italy carried out a sizeable fiscal adjustment between 2010 and 2013, with the headline deficit below 3 % of GDP as of 2012 (from more than 5 % in 2009) (see Section 1) and the primary surplus increasing to over 2 % of GDP. The Italian government eased its fiscal stance in recent years to support economic growth mainly by cutting the tax burden (see Sections 1 and 4.1) and by taking advantage of the fiscal space created by lower interest expenditure (-1.2 percentage points of GDP between 2012 and 2016). The headline deficit is set to decline to just below 2.5 % of GDP in 2016-2017, while the primary surplus is forecast to stabilise at around 1.5 % of GDP. In structural terms, the primary surplus is estimated to have declined from 3.9 % of GDP in 2013 to 2.3 % in 2016, and is expected to shrink further to 1.9 % in 2017. This relaxation in the fiscal stance was partially used to support investment and facilitate the adoption and implementation of structural reforms (for instance through tax incentives), while reducing the risk of entering a low-inflation-low-growth trap. Despite the rather low primary surplus, debt refinancing risks are mitigated in the short term by the ample liquidity provided by the

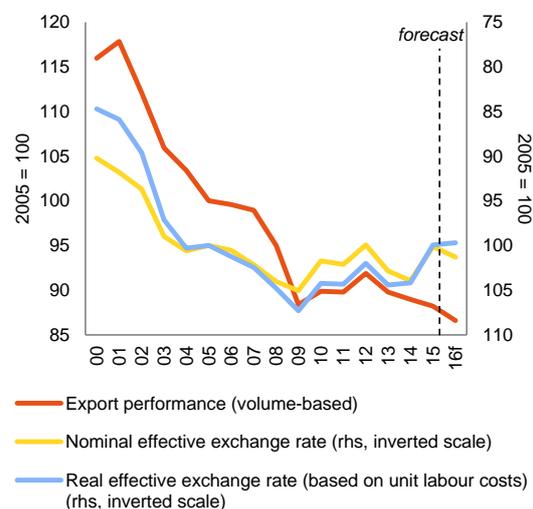

ECB and the country's improved external position which makes it less reliant on external capital flows. Looking forward, a structural primary surplus of 1.3 % of GDP, as projected in the Commission forecast in 2018 (based on a no-policy-change assumption), would increase sustainability risks in the medium term (European Commission, 2016c). In particular, a weak fiscal position when the accommodative monetary policy is eventually phased out might raise risk premia. By contrast, a progressively improving fiscal position would help to maintain financial markets' confidence and low interest rates, which would in turn support private investment and growth prospects.

The share of government securities held by Italian banks has decreased only slightly. Since the start of the ECB's Public Sector Purchase Programme (PSPP) at the beginning of 2015, the share of public debt held by the Bank of Italy increased substantially. However, only a minor reduction was recorded in Italian banks' exposure to the sovereign (from EUR 398 billion at the end of 2015 to EUR 383 billion, or 23 % of GDP, at the end of 2016). At the same time, foreign private investors remain rather reluctant to invest in Italy and their share of public debt declined slightly (from 30 % in June 2015 to 28.4 % in June 2016)⁽¹⁵⁾ (Bank of Italy, 2016a). Furthermore, due to low or negative interest rates, Italian households cut their direct holdings of government bonds and further diversified their financial investment, increasing their exposure to foreign markets. The Public Sector Purchase Programme and favourable long-term refinancing conditions for banks, together with the lack of appetite for financial investment in Italy and the continued diversification of residents' portfolios into foreign assets entail increasing TARGET2 liabilities of the Bank of Italy towards the Eurosystem (EUR 357 billion or more than 20 % of GDP at the end of 2016, from EUR 249 billion at the end of 2015).

The average debt maturity increased slightly but spreads vis-à-vis German sovereign bond yields have widened. Regarding debt structure, Italy's debt management office took advantage of historically low interest rates through the increase

in long-term fixed-rate bonds issuances. As a result, the average maturity of government bonds rose to 6.76 years in December 2016 (from 6.52 and 6.38 years at the end of 2015 and 2014 respectively), while the share of long-term fixed-rate bonds rose to around 70 % (from 68 % at end-2015). However, after averaging around 130 basis points in the first ten months of 2016, spreads between Italian and German 10-year bond yields widened and stood at more than 170 basis points in January 2017, possibly due to political uncertainty.

Graph 3.2: Italy's export performance, exchange rate and cost competitiveness indicators

Notes: Indicators are with respect to 36 industrial countries.
Source: European Commission

Italy's export performance broadly stabilised, also supported by the depreciation of the euro.

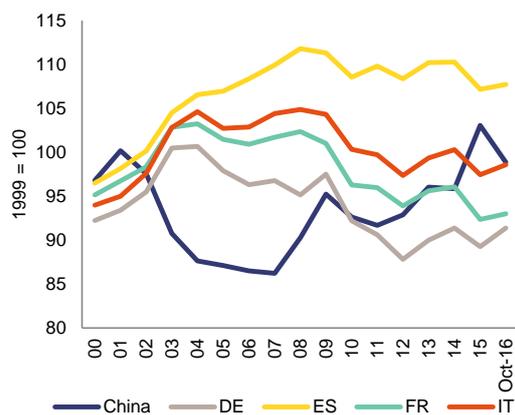

After sizeable export market share losses in the first decade of the century, Italian exports (in volumes) have been growing at a pace more in line with external demand since 2010 (Graph 3.2). The improved export performance has been supported by the depreciation of the euro, which entailed some decline in Italy's nominal effective exchange rate vis-à-vis its trade partners. These developments, together with moderate increases in unit labour costs, led to a moderate recovery in the country's cost competitiveness in recent years. Still, despite the more favourable exchange rate, slight market share losses are expected for 2016.

Italy's price competitiveness based on producer prices has somewhat improved. The producer price gap accumulated vis-à-vis France and Germany since euro adoption has stabilised.

⁽¹⁵⁾ Excluding foreign mutual funds and other managed investment attributable to Italian investors

However, the rather positive price competitiveness performance of Italian manufacturing firms implied a steady reduction in their profit margins up to 2013 mainly due to more dynamic developments in nominal unit labour costs. In recent years, manufacturing firms' profit margins have recovered somewhat thanks to the moderation in nominal unit labour costs and lower energy costs (Centro Studi Confindustria, 2016). Furthermore, the growth of Italy's manufacturing producer prices has been significantly more moderate than the one of China's since 2007, possibly due to the upgrade of the global supply chain production of China (Graph 3.3).

Graph 3.3: Price competitiveness based on producer prices in manufacturing, 12-month averages

Notes: Indicators are with respect to 61 competitor countries. An increase in an index indicates a loss of competitiveness.

Source: Bank of Italy (based on ECB, CEPII, Eurostat, IMF, OECD and UN data and national statistics)

Progress in reducing the large stock of non-performing loans (NPLs) is limited. Compared to the end of 2015, the gross stock of NPLs has come down only marginally. The inflow of new NPLs has decreased since early 2015, but unlikely-to-pay and to a lesser extent past-due loans are still migrating to the bad loan category. Meanwhile, several factors still hold back the pace at which banks are working out or selling NPLs. These include in particular the considerable gap between the valuation of NPLs by banks and investors which hinders the development of a secondary market for impaired assets in Italy, as well as banks' low internal capital generation and impaired capacity to raise fresh capital so further loan losses could be absorbed. Several measures have been taken by the authorities to help banks

address their NPL problem and to increase the efficiency of the banking sector (see Section 4.2).

The labour market is improving gradually. Employment developments since 2014 have been rather positive in Italy, despite the weak economic recovery. After increasing by 0.4 % in 2014 and 0.8 % in 2015, employment rose by 1.2 % in 2016. The abolition of the regional tax on economic activities (*IRAP*) on permanent employment, the labour market reform and tax incentives for new permanent hires contributed to this improvement. However, slow economic growth has not been conducive to a swift absorption of long-term unemployment and of youngsters entering the labour market.

Overall assessment

In spite of a few positive developments, macroeconomic imbalances are not unwinding yet. The public debt-to-GDP ratio is expected to have risen further to around 133 % in 2016 and to remain at that level in the coming years. The high public debt thus remains a major source of vulnerability for the Italian economy and a source of negative spillovers for the euro area. Moreover, structural shortcomings continue to hamper investment, innovation and a faster upgrade of Italy's production structure. The resulting low productivity growth suggests that further progress with reforms is needed to enhance Italy's growth prospects and facilitate public sector deleveraging. External cost and price competitiveness stabilised thanks to the depreciation of the euro and overall wage moderation. The adjustment process in the labour market is proceeding gradually with labour market participation and employment on the rise, resulting in a gradual decline in the unemployment rate. Still, long-term and youth unemployment remain high and weigh on growth prospects. The adjustment in the banking sector in response to the crisis-driven deterioration in asset quality and long-standing structural weaknesses continues to face significant challenges. Several reforms were implemented to address the 2016 country-specific recommendations, which in the case of Italy are all related to its macroeconomic imbalances (see Section 2). However, most of these reforms, if consistently implemented, will impact on significant stock imbalances (e.g. the high public debt ratio) only in the medium term.

Box 3.1: Spillovers

Italy's economy is the third largest in the euro area. Accounting for 16 % of the area's GDP, Italy is a major potential source of economic and financial spillovers for the rest of the euro area.

Direct trade links between Italy and other euro area countries are sizeable. Italy is an important market for Slovenia, Slovakia, Belgium and the Netherlands, which export goods to Italy for over 3 % of their respective GDP, and for Luxembourg, that mainly exports services (for more than 9 % of its GDP). Italy's exports of goods and services to the rest of the euro area amount to 12 % of its GDP. Italy's economy is thus subject to large spillovers from demand developments, particularly in Germany and France, but also in Spain, Belgium, the Netherlands and Austria.

Demand from the rest of the euro area improved in recent years. Following the sovereign-debt crisis, the deleveraging stance in the euro area meant that the trade channel could support Italian economic growth. Large and rising current-account surpluses in some euro area trade partners seem to point to weaknesses in investment and consumption levels. Subdued demand from these economies in turn puts a strain on Italy's exports. However, demand from the rest of the euro area (in particular Spain) has been more dynamic since 2014.

The banking union has only slightly increased the exposure of banks in other euro area countries to the Italian economy. The French banking sector remains the most directly exposed to Italy. French banks' exposure to the Italian economy amounted to approximately 12 % of French GDP in Q2 2016, albeit 7.9 % consists of claims on the non-bank private sector. For other euro area banks, financial links to the Italian economy relate mainly to the official sector, with a direct exposure of 1-2 % of the GDP of the country in question.

Italian banks are strongly exposed to the German and Austrian economies. In Q2 2016, Italian banks' exposure to Germany and Austria amounted to 10.5 % and 3.1 % of Italy's GDP respectively, and consisted mainly in claims towards the non-bank private sector. Italian banks' direct exposure to other euro area countries' official sectors is relevant only for Germany (2.3 %) and Spain (2 %).

Italy's high public debt remains a source of possible adverse spillovers for the rest of the euro area. Its public debt-to-GDP ratio is projected to remain very high in the coming years and its reduction may be subject to adverse shocks, particularly if the structural primary surplus worsens further and/or reform action comes to a halt. The euro area's accommodative monetary

policy helped to reduce sovereign spreads and is reassuring financial markets about future nominal growth prospects. Still, a change in the currently favourable risk perception cannot be ruled out, particularly if national policies were to depart from the differentiated adjustment needed for a sustained euro area recovery. It is worth recalling that general risk perception is one of the main determinants of sovereign spreads in the euro area.

A QUEST model simulation shows that an increase of Italy's government risk premium could significantly affect euro area growth. The simulation assumes a 200 basis point increase in Italy's sovereign risk premium for two years (e.g. if reform setbacks increase risk aversion), which then decays (very) gradually (Kollmann et al., 2016). The increase is assumed to raise other euro area vulnerable countries' financing costs by 100 basis points. Half of the increase in governments' risk premiums is assumed to spill over to the private sector's financing costs. The central scenario also assumes a binding zero lower bound on ECB rates for the first two years. Spillovers to the rest of the euro area are driven by the trade channel and the temporary increase in real interest rates (due to a constant policy rate and below-target inflation). The simulation suggests that Italy's and to a lesser extent other vulnerable countries' real GDP would quickly go below the baseline and would not recover in the next ten years. The impact would also be negative but smaller and less persistent for the rest of the euro area (Graph 1). The effects may worsen if further fiscal consolidation were needed to stop the risk premium increase and cover the higher debt financing costs (as during the sovereign debt crisis).

Graph 1: Real GDP impact from a higher government risk premium in Italy

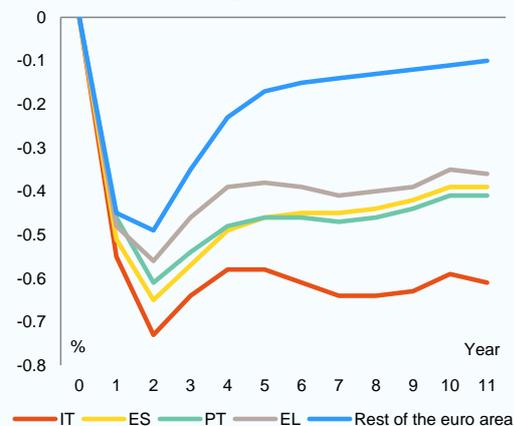

Table 3.1: MIP Assessment Matrix (*) - Italy

	Gravity of the challenge	Evolution and prospects	Policy response
Imbalances (unsustainable trends, vulnerabilities and associated risks)			
Productivity	<p>Italy's labour productivity growth has been sluggish for almost 20 years, primarily due to total factor productivity dynamics and, more recently, insufficient capital accumulation (see Sections 1 and 4.4).</p> <p>Weak productivity dynamics hamper competitiveness and entail low GDP growth, which in turn affects public debt ratio dynamics.</p> <p>Weak productivity growth is rooted in long-standing weaknesses in the functioning of labour, capital and product markets, compounded by inefficiencies in the public administration and justice system.</p>	<p>The crisis has aggravated labour productivity dynamics. In 2008-2013, productivity per hour worked remained broadly stable, while total factor productivity declined by around 5 %.</p> <p>Labour productivity (based on hours worked) is expected to have declined by 0.5 % in 2014-2016, due to negative capital deepening, while total factor productivity started rising, albeit at a subdued pace. Labour productivity is forecast to grow only moderately in 2017 and 2018, well below the growth rate forecast for the euro area.</p>	<p>Italy is implementing significant reforms of the labour market, the banking sector, the education system, publication administration and the justice system, which have been adopted over the last two years.</p> <p>The reforms are aimed at addressing the bottlenecks that hold back productivity growth. Benefits will accrue mostly in the medium term. Positive significant impacts are already evident from the labour market reform, which is helping to reduce labour market duality.</p> <p>There was some slowdown of the reform process since mid-2016.</p>
Public debt	<p>In 2015, Italy's public debt-to-GDP ratio stood at 132.3 %, up from a pre-crisis level in 2007 of around 100 %. Italy's high public indebtedness is a major source of vulnerability for the Italian economy.</p> <p>Furthermore, given its size, Italy's public debt is a potential source of negative spillovers to the euro area.</p>	<p>Negative growth and low inflation pushed up the public debt-to-GDP ratio in recent years. The ratio is expected to broadly stabilise in 2016-2018 at around 133 %.</p> <p>However, the structural primary surplus is expected to have declined significantly since 2013 and is forecast to worsen further in 2017 and 2018.</p>	<p>Measures taken include a review of public expenditure and a privatisation programme.</p> <p>The structural reforms to foster productivity growth are expected to make public debt more sustainable.</p> <p>Past pension reforms should support long-term public debt sustainability, but some measures in the 2017 Budget Law go in the opposite direction.</p>
External competitiveness	<p>In recent decades, Italy has lost export market share, although losses have stopped since 2013.</p> <p>Deteriorating cost competitiveness has been one of the main factors driving the loss of export market share.</p> <p>Non-cost competitiveness factors, including product specialisation and the high proportion of small firms with a weak competitive position in international markets, remain insufficiently supportive.</p> <p>The current account surplus is approaching 3 % of GDP. Italy's net international investment position, at around -20 % of GDP in June 2016, does not pose sustainability concerns, though the level of net marketable debt is relatively high.</p>	<p>Italy has recorded very small gains in export market share since 2013. The gains are small compared to losses in preceding years and could be partly explained by the mechanical effect of the slowdown of global trade.</p> <p>Moderate wage growth, reflecting the weak labour market, and the depreciation of the euro have allowed a gradual improvement in the real effective exchange rate based on unit labour costs, but not sufficiently to restore past competitiveness losses.</p>	<p>Structural reforms to foster productivity growth will help to improve cost and non-cost competitiveness.</p> <p>Policy gaps include the lack of steps to better align wages with productivity, and of measures to promote firm growth. In particular, the reform of the framework for collective bargaining has incurred a delay.</p>
Adjustment issues			
Labour market participation and unemployment	<p>The unemployment rate more than doubled during the crisis to peak at more than 12.5 % in 2014. The long-term unemployment rate increased steadily over the period for all age groups.</p> <p>The participation rate grew moderately during the crisis but remains the lowest in the EU.</p> <p>The risk of labour market exclusion increased particularly for youngsters: youth unemployment more than doubled during the crisis to peak at 43.1 % in the first quarter of 2014.</p>	<p>Despite the weak economic recovery, employment increased by 0.8 % in 2015 and by 1.2 % in 2016.</p> <p>As more people entered the labour market, the rate of unemployment averaged 11.7 % in 2016, slightly down from 11.9 % in 2015.</p> <p>Long-term unemployment is not yet decreasing. Conversely, youth unemployment started to decline, but remained very high at 40 % in December 2016. The proportion of young people not in employment, education or training is among the highest in the EU (about 20 % among those aged 15-24).</p>	<p>The labour market reform and hiring incentives are supporting job growth.</p> <p>The reform of active labour market policies and the strengthening of work-based learning could help to improve labour market matching and support the transition from education to work in the medium term.</p> <p>However, implementation is likely to be challenging.</p> <p>Measures to foster labour market participation, including among women, are limited.</p>

(Continued on the next page)

Table (continued)

Banks' asset quality	<p>The slow-burning impact of the protracted economic crisis led to a systemic deterioration of Italian banks' asset quality, triggering significant loan-loss provisions that weigh on banks' profitability, reducing market confidence in banks and leading to conservative lending policies, in particular vis-à-vis small firms.</p> <p>In Q3 2016, the gross stock of non-performing loans (NPLs) amounted to EUR 329 billion (16.5 % of customer loans). The average coverage ratio is just above 46 %.</p> <p>Due to their asset quality problem, Italian banks continue to be vulnerable to shocks, and as the support they can give to Italy's gradual economic recovery appears limited, they risk becoming a potential source of economic spillovers for other euro area countries.</p>	<p>Since the end of 2015, the gross stock of NPLs has declined only marginally. Recapitalisation needs may emerge to clean up banks' balance sheets given banks' low profitability.</p> <p>The ongoing recovery and conservative lending policies have significantly reduced the inflow of new problem loans, but unlikely-to-pay loans continue to turn into bad loans.</p> <p>The work-out and disposal of NPLs is proceeding only at a very slow pace, mainly owing to a persistent NPL pricing gap that holds back the development of a secondary market for impaired loans in Italy. Some banks may also prefer to wait for better recovery prospects or be unwilling to terminate client relationships. Regulatory factors may also play a role in holding back NPL disposals.</p>	<p>In spring 2016, a bad-loan securitisation scheme supported by state guarantees (GACS) was set up. Furthermore, two private 'Atlante' funds have been created to support vulnerable banks' bad-loan securitisations and recapitalisations.</p> <p>A further reform of insolvency and collateral enforcement rules was adopted in 2016, in anticipation of a broader overhaul of the framework.</p> <p>At the end of 2016, EUR 20 billion was set aside for liquidity support and precautionary recapitalisations, but it is not clear yet what role this will play in cleaning up Italian banks.</p> <p>Supervisors have become more assertive, e.g. through more demanding reporting requirements and impaired loan reduction targets for the most vulnerable banks.</p>
Conclusions from the IDR analysis			
<ul style="list-style-type: none"> • Very high government debt represents a major economic burden and vulnerability. Persistently slow productivity growth continues to be the root source of Italy's macroeconomic imbalances, by reducing the pace of debt reduction and weakening on external competitiveness. The high stock of non-performing loans still weighs on banks' profits and lending policies. High long-term unemployment holds back future growth • The public debt ratio is expected to stabilise at around 133 % in 2017 and 2018. Wage growth has moderated, but weak labour productivity growth holds back the relative adjustment in unit labour costs, while non-cost aspects remain insufficiently supportive of external competitiveness. Labour participation and employment are rising, but long-term unemployment is not declining yet and youth unemployment remains high. In the banking sector, the gross stock of NPLs has not yet started to decline significantly owing to the slow pace of problem-loan work-out and disposal. Recapitalisation needs may emerge to clean up banks' balance sheets, given current low profitability in the banking sector. • The reform of the budgetary process might help improve public debt sustainability. To help banks dispose of problem loans, further insolvency and foreclosure reforms have been enacted and a bad loan securitisation scheme with state guarantees has been set up. Supervisors have become more demanding and the government has earmarked funds to conduct precautionary recapitalisations of eligible vulnerable banks. The reform of the education system, public administration and justice are implemented. However, the reform momentum has weakened since mid-2016. Market opening measures are being delayed and policy gaps remain notably with regard to taxation and the fight against corruption. Following the comprehensive labour market reform, the operationalisation of the new setting for active labour market policies may face challenges. Furthermore, there are delays in the reform of the framework for collective bargaining. 			
<p>(*) The first column summarises 'gravity' issues which aim at providing an order of magnitude of the level of imbalances. The second column reports findings concerning the 'evolution and prospects' of imbalances. The third column reports recent and planned relevant measures. Findings are reported for each source of imbalance and adjustment issue. The final three paragraphs of the matrix summarise the overall challenges, in terms of their gravity, developments and prospects, policy response.</p>

4. REFORM PRIORITIES

4.1. PUBLIC FINANCES AND TAXATION

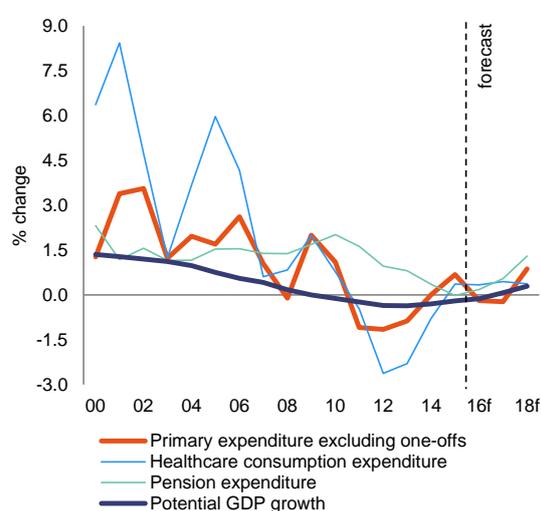

4.1.1. FISCAL FRAMEWORK*

A major challenge for Italy is to align public expenditure dynamics with sluggish potential growth. Real general government primary expenditure has been increasing above potential growth since the end of the 1990s (Graph 4.1.1). This reflects both insufficient containment of specific spending items such as pensions and healthcare, and low potential growth. The dynamics of real healthcare expenditure were contained significantly after the excessive deficit procedure in 2005-2008 and entered negative territory when the sovereign debt crisis required swift action to restore fiscal sustainability. Moreover, the ‘Fornero’ reform started restraining real pension spending in 2012. All this contributed to primary expenditure growing below (negative) potential growth in 2010-2013 and broadly coming into line thereafter. However, expenditure control was also pursued through cuts in investment spending in infrastructure, education and innovation, which may have further weighed on the already low potential economic growth. As a result, unless the scope of government action is reduced or potential growth is restored, it may be difficult to compress further real primary spending in line with the expenditure benchmark of the Stability and Growth Pact to fund a cut in the tax burden on the factors of production (Lorenzani and Reitano, 2015).

Recent measures on pensions go in the wrong direction. In 2007-2011, the level of pension spending as share of GDP increased markedly, before the Fornero reform contributed to its slowdown (Graph 4.1.2). As a result of the pension reforms enacted as of 2004, and in particular the Fornero reform, the average retirement age will increase from 60 to 68 years by 2050, thus resulting in lower cumulative pension expenditure by 60 % of GDP in the long term (Ministry of Economy and Finance, 2016a). However, the 2017 budget involves measures that partially reverse the Fornero reform: minimum pensions are raised, earlier retirement is allowed for specific categories of employees (either on a voluntary basis through a bank loan supported by a tax credit or as social

care measures introduced on an experimental basis for workers in need), and some penalties previously introduced to offset incentives for early retirement under the old generous defined-benefit system will be repealed as of 2018. Such measures (not reflected in Graph 4.1.2) are set to raise the already-high pension expenditure in Italy (at 15.4 % in 2015, one of the highest in the OECD as a share of GDP, and over a third of total primary expenditure in Italy), causing it to grow above potential growth (Graph 4.1.1). As a result, resources may be taken away from more growth-enhancing measures to the detriment of younger generations. This has been highlighted also by the now fully operational Parliamentary Budget Office, Italy’s independent fiscal monitoring institution. Besides, the emphasis on the need to work longer and achieve higher labour market participation could be further weakened, with negative impact on growth prospects.

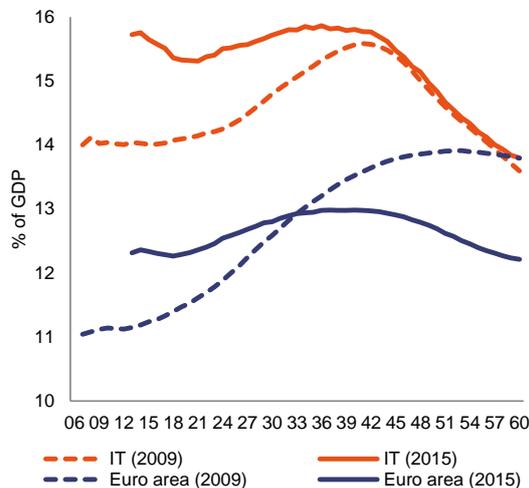

Graph 4.1.1: Evolution of government real primary expenditure and potential GDP growth

Potential GDP growth is reported as a 10-year average (from t-5 to t+4) in line with the reference rate of the expenditure benchmark of the Stability and Growth Pact. The real growth rates of expenditure components are computed using the GDP deflator and are reported as 2-year moving averages.

Graph 4.1.2: Long-term projections of gross public pensions expenditure

Source: European Commission, 2009; European Commission, 2015b.

The ongoing spending review also involves revising the budgetary process and centralising public procurement. Savings targets have been gradually reduced, partly because they turned out to be ambitious without addressing large spending items such as pensions or public transport and given the limited state leverage on regional and local spending. However, further measures to rationalise public spending were taken in 2016 and the reform of the budgetary process (started in 2009) was finalised. More specifically: (i) the content and function of programmes in the budget are specified by emphasising the targets to be achieved; (ii) a reinforced cash principle is set to improve management and monitoring; (iii) planned revenues and expenditure allocations are integrated in one act, together with the legislative acts needed to reach the target. If consistently implemented, these measures may in the future make the spending review a more structural feature of the budgetary process and better align the latter with a performance-budgeting approach. The systematic implementation of each ministry's spending review targets has been *de facto* postponed to 2017, however. Frequent updates of the budgetary targets weaken the medium-term budgetary framework, and the recent practice of including large tax increases ('safeguard clauses') in the three-year budget to fill the gap between trends and targets and repealing them later made the budget unreliable for medium-term planning. On the positive side, ministers were directly involved

in selecting areas of their own budgets contributing to targeted savings; centralised public procurement is being gradually extended to the regional level and 36 000 purchasing bodies have been reduced to 33 aggregator centres, with around EUR 16 billion (0.9 % of GDP) of annual public spending under their remit. The government has recently identified spending thresholds and 34 product categories for which administrations should opt for centralised procurement, and a technical working group is proposing further categories. The national anti-corruption authority has a role in assessing these categories and supervising centralised procurement.

4.1.2. TAXATION*

The tax burden on production factors, one of the highest in the EU, has been gradually reduced. In 2015, Italy's tax wedges on low-wage and average-wage single workers were among the highest in the EU, at 41 % and 48 % respectively (European Commission, 2016e). In 2014, the implicit tax rate on labour was the highest in the EU (44 %, as against the EU average of 36 %) and the tax burden on capital stood well above the EU average (10.6 % of GDP, as against 8.2 %). Moreover, features of Italy's tax collection system might further deter investment, as it takes much longer than in the rest of the EU for a small business to file tax returns (240 hours per year, as against the EU average of 176) (World Bank, 2016). Therefore, the 2015 and 2016 budgets reduced the labour tax wedge and corporate income taxes ⁽¹⁶⁾, and the 2017 budget included a new flat-tax regime for small businesses (*IRI*) and incentives for private investment (see Sections 4.4

⁽¹⁶⁾ The 2015 budget made permanent a tax credit of EUR 80 per month for low/medium-income employees (annual impact of 0.6 % of GDP) and provided for a permanent exemption of the labour cost from the *IRAP* tax base (annual impact of 0.4 % of GDP). The tax wedge on low-wage earners dropped from 45 % to 41 % over 2013-2015 (OECD, 2016a). If the permanent tax credit to low-wage employees recorded as social transfer ('monthly bonus of EUR 80') was taken into account, the implicit tax rate on labour would be 43 %. A three-year exemption of employers' social security contributions for new hires with open-ended contracts concluded in 2015 was also adopted and extended to new hires in 2016 (with a 40 % exemption) through the 2016 budget (overall 0.4 % of GDP in 2017). The corporate income tax rate was cut from 27.5 % to 24 % (annual impact of 0.2 % of GDP).

and 4.5). The ‘Committee on Environmental Taxation’ has yet to be established.

A well-designed tax shift to consumption has the potential to further reduce the tax burden on labour and tackle poverty and inequality. Limited progress has been made in reforming cadastral values and revising tax expenditures, in line with the objective to shift the tax burden from labour to consumption and property. Simulations carried out with EUROMOD (Box 4.1.1) show that increasing the reduced VAT rate from 10 % to 13 % and fully using these revenues for a refundable tax credit on employment income for low-income workers would be progressive. It would raise net disposable income for the lowest income deciles and result in lower poverty and inequality (measured by the Gini index). Moreover, the larger the tax shift, the higher the probability for the unemployed to enter the labour market. At the same time, the generosity of the new tax credit would increase the incentive to work part-time instead of full-time. However, this offsetting effect, resulting in an overall negligible impact on labour supply, could be avoided by the adequate design of the tax credit.

Despite some progress in this area, the rather limited use of electronic invoicing and payments affects the fight against tax evasion In 2014, Italy’s VAT gap⁽¹⁷⁾ was among the highest in the EU, at EUR 36.9 billion (or 2.3 % of GDP), i.e. 28 % of the whole EU gap. The total tax gap is estimated at around 6 % of GDP (or some EUR 99 billion) (Ministry of Economy, 2016b). Recent measures to increase tax compliance, such as mandatory electronic invoicing together with the ‘split payment’ for government bodies’ purchases⁽¹⁸⁾, and the reverse charge in specific sectors seem to have been effective, with a yearly increase in gross VAT on internal transactions of more than 6 % between January and November 2016. However, electronic invoicing is not compulsory among privates, the use of electronic payments remains well below the EU average and limits to the use of cash have recently been

raised.⁽¹⁹⁾ On the other hand, tax collection was streamlined in order to improve compliance, with the introduction of pre-filled declarations, incentives for firms to opt for electronic invoicing in return for milder tax controls as of 2017, and simplified arrangements (*regime forfettario*) for small firms, taken up by many newly registered VAT taxpayers.⁽²⁰⁾ Moreover, the 2017 budget introduced transparency provisions on the communication of invoices and VAT data, which are expected to improve compliance, and a tax administration reform, merging the tax-recovery agency *Equitalia* with the revenue agency to improve tax collection and foregoing sanctions on taxpayers who voluntarily regularise themselves for unpaid taxes in 2000-2016. The budgetary impact of the latter reform depends on taxpayers’ behaviour and will be mostly one-off. The same applies to the extension until July 2017 of the voluntary disclosure of assets held abroad or not declared.

The government aims to increase tax compliance and reduce the ground for tax litigation. New ‘cooperative compliance’ arrangements, whereby the tax authorities proactively help firms to fulfil their more complex tax obligations, and pre-filled tax declarations addressed to specific taxpayers categories might help to increase tax compliance and reduce the ground for tax litigation in Italy. Namely, in 2015, the total inflow of cases to the provincial (first-instance) and regional (second-instance) committees where tax cases are dealt with by part-time non-professional judges (*magistrati tributari*) was significant and broadly stable compared to 2012, despite the introduction of tax mediation in that year. Moreover, a tenth of the backlog had been pending for over five years (Ministry of Economy, 2016c). The tax section of the Supreme Court of Cassation was the one that contributed most to its inflow (i.e. 38.4 %) and its backlog (i.e. 32.7 %) of civil cases, both among the highest in the EU⁽²¹⁾ (European Commission, 2017b). It also

⁽¹⁷⁾ The VAT gap is the difference between the actual VAT revenues and those expected by applying the standard rate to the potential tax base.

⁽¹⁸⁾ With the split payment, public administration payments to private suppliers of goods and services do not include VAT, which is directly paid to the state budget.

⁽¹⁹⁾ For instance, according to the ECB payments statistics, card payments per capita in 2015 amounted to around EUR 2 600, as against the EU average of over EUR 5 000.

⁽²⁰⁾ www.finanze.it/opencms/it/statistiche-fiscali/osservatorio-sulle-partite-iva/

⁽²¹⁾ 100 351 civil and commercial cases were pending at third instance in 2014, around twice the number in the Supreme Court, with the second highest backlog in the EU.

had the lowest clearance rate⁽²²⁾ and a 50 % rate of appeals granted (Corte di Cassazione, 2015). While organisational measures to improve the functioning of the tax section and to speed up tax proceedings have been introduced, such as the 'digital tax trial', there remains room for improving the effectiveness of the justice system in tax cases (Corte di Cassazione, 2017, p. 80). To this aim, the government set up a high-level Technical Committee to develop a proposal inspired by the best international practices. Consistently, a draft enabling law under discussion in Parliament aims to empower the government to present a proposal to bring all tax cases within the competence of civil tribunals, while increasing the number of judges by 750.

⁽²²⁾ The clearance rate, defined as the ratio of resolved to incoming cases, stood at 46 %.

Box 4.1.1: Distributional effects of a tax shift from labour to consumption

In the case of Italy, simulations of the distributional effects of a tax shift from labour to consumption have been conducted by the Joint Research Centre of the European Commission using EUROMOD ⁽¹⁾. The budgetary and distributional effects of two scenarios of a tax shift, based on existing legislation and on an ongoing policy debate in the country, were simulated: (**Scenario 1**) the VAT reduced rate is increased from 10 % to 13 % and the extra resources are used for either (**Scenario 1A**) a refundable tax credit for employment income, or (**Scenario 1B**) a refundable tax credit for employment and self-employment income; (**Scenario 2**) the VAT reduced rate is increased from 10 % to 13 % and the VAT standard rate from 22 % to 24 % and the extra resources are used for either (**Scenario 2A**) a refundable tax credit for employment income, or (**Scenario 2B**) a refundable tax credit for employment and self-employment income. Scenario 2 is based on an already legislated 'safeguard clause' and scenario 1 is based on a commitment included in the 2016 Stability Programme ⁽²⁾. The latter is in line with the recommendation to rationalise tax expenditures (including reduced VAT rates) and national legislation requiring an annual revision of tax expenditures. The simulated destination of the related revenues is in line with the government's repeated announcement to further reduce labour taxation.

All four scenarios correspond to revenue-neutral reforms in the first round, as potential beneficial effects on the labour supply and correspondingly on labour taxes due to the new tax credits, are not taken into account. Table 1 shows that the net effect of these reforms is generally progressive: the increase in disposable income due to the new tax credits in fact more than offsets its reduction due to higher VAT rates for most households (the bottom five deciles under scenarios 1A and 1B and the bottom six deciles under scenarios 2A and 2B). These results are confirmed in Table 2 by synthetic indicators on the distributional effect of the reforms: poverty and, to a lesser extent, inequality (measured by the Gini index) are reduced in all four scenarios, with the largest redistributive effect in scenario 2B (i.e. increasing both reduced and standard VAT rates and increasing refundable tax credits for employment and self-employment income).

Table 1: Equalised mean disposable income (by decile) after the revenue-neutral tax shift

Decile	Baseline scenario	Scenario 1A	Scenario 1B	Scenario 2A	Scenario 2B	Difference 1A (%)	Difference 1B (%)	Difference 2A (%)	Difference 2B (%)

Difference from baseline scenario		-0.16	-0.16	-0.30	-0.34

Notes: Adjusted disposable income includes payments for indirect taxes.

- ⁽¹⁾ 'EUROMOD extension – Indirect Tax Tool' is the tax-benefit microsimulation model for the EU. It simulates the benefit entitlements and tax liabilities (including social security contributions) of individuals and households according to the tax-benefit rules in place in each Member State. The simulations are based on representative survey data from the European Statistics on Income and Living Conditions (EU-SILC) and cover the main elements of direct taxation, social contributions and non-contributory benefits.
- ⁽²⁾ Italy's 2016 budget provided for standard and reduced VAT rate increases as of 2017 (from 22 % to 24 % and from 10 % to 13 % respectively) to ensure the achievement of the planned deficit target (1.4 % of GDP) in 2017. The revenues from the clause's activation were estimated at 0.9 % of GDP. The 2016 Stability Programme announced the repeal of the VAT hike and a commitment to its partial compensation to reach the new deficit target of 1.8 % of GDP in 2017 through a still-unspecified mix of spending cuts, including tax expenditures and measures to enhance tax compliance. Nevertheless, the 2017 budget repealed the safeguard clause with only minor compensation, leading to a revised deficit target of 2.3 % of GDP in 2017.

General banking sector developments*

Confidence in the Italian banking sector has fallen in spite of the several measures taken by the government. The loss of market confidence is reflected in the large drop of Italian banks' share prices in 2016, despite significant bank-by-bank differences. There are two main reasons behind this development: (i) the persistent uncertainty related to the adequacy of loan loss provisions and capital buffers, given the existing high stock of non-performing loans and banks' limited ability to absorb losses in a context of subdued profitability; (ii) the weak growth outlook, depressing banks' profitability, coupled with longstanding structural weaknesses, including high operational costs and corporate governance flaws. The difficulty to find a market solution to address capital shortfalls for some banks, and the widespread mis-selling of bank bonds to retail customers, who can claim

compensation from banks, have further added to this complex picture. As a result, and despite policy measures already taken, the Italian banking sector continues to be vulnerable to shocks. Furthermore, the support it can give to a gradual economic recovery appears limited and it might therefore become a potential source of economic spillovers for other euro area countries.

Banking sector capitalisation has improved marginally, but continues to lag behind that of other European peers. Due to retained earnings and private capital increases, the average common equity tier 1 and total capital ratio rose to 12.4 % and 15.3 % respectively in Q2 2016. However, there are significant bank-by-bank differences. The Italian banking sector still lags behind other euro area banking systems and ranks close to the bottom with regard to the main solvency indicators (EBA, 2016). Low profitability and unfavourable market

4.2. FINANCIAL SECTOR

Table 4.2.1: Italian banking sector key indicators

Indicator	2008	2009	2010	2011	2012	2013	2014	2015	Q2 2016
Total assets (EUR billion)	3,634.6	3,690.7	3,758.9	4,034.7	4,211.0	4,038.3	4,014.3	3,914.7	3,978.4

Notes: In general, figures are the latest available and are taken at the end of the indicated periods (i.e. December for full years, June for Q2), including average interest rates on new loans to firms and households. Average interest rates on new loans to households related only to house purchase loans. Gross non-performing loans are gross of loan-loss provisions. Bad loans are the worst category of non-performing loans. Domestic sovereign exposure relates only to sovereign debt securities. Loan value adjustments as % of operating profit and return on equity (gross and net of goodwill impairments) in the last column relate only to the first half of 2016. '-' indicates that a figure is not available.

Source: Bank of Italy

conditions hold back the further strengthening of capital buffers, especially for more vulnerable banks.

Progress in reducing the large stock of problem loans is limited. From the end of 2015, the stock of non-performing loans – gross of loan-loss provisions – declined only marginally to EUR 329 billion in Q3 2016 (16.5% in customer loans, triple the pre-crisis level). Bad loans stood at EUR 198 billion (and EUR 85 billion net of provisions). Although the ongoing recovery has significantly reduced the inflow of new problem loans, the work-out or disposal of such loans has proceeded very slowly so far (see ‘Impaired asset developments’ in this section). The sector has continued to raise coverage ratios, which are now above the EU average, although there are significant bank-by-bank differences.

Banking sector profitability continues to remain low. In the first half of 2016, the average return on equity stood at 2.5 %, at the bottom of the ranking of euro area banking systems. The low profitability is driven by several factors: (i) the low-interest-rate environment and price competition for the most creditworthy borrowers, which reduce net interest margins that are key to Italian banks’ traditional business models; (ii) the subdued credit recovery (see Section 1); (iii) the reduction in non-interest income due to unfavourable market developments; (iv) the increase in non-recurring expenses (e.g. early-retirement measures, resolution fund contributions); (v) significant loan-loss provisioning, albeit at a decreasing pace compared to the recent past. The sector’s cost-to-income ratio increased as modest cost-cutting efforts may only become visible over time and were more than offset by declining revenues.

The consolidation of the Italian banking system is proceeding very slowly. Consolidation could help to improve cost-efficiency and profitability and to increase capacity to manage problem loans and invest in digital technologies. Despite a decline in the number of banks in Italy since 2008, the sector remains highly fragmented. Since the start of the crisis, numbers of bank branches and employees have declined by around 10 %. However, recent corporate governance reforms (see ‘Corporate governance reforms’ in this section) are supposed to foster consolidation in some segments. Furthermore, some vulnerable

medium-sized and small banks may be taken over by stronger entities or merge after their balance sheets have been cleaned up. Finally, the 2017 Budget Law extends the financing and scope of the sector’s solidarity fund for the retraining and requalification of bank employees and establishes fiscal incentives for staff reorganisations in the context of restructuring or mergers.

Medium-sized and small Italian banks appear more vulnerable than large credit institutions. ‘Less significant institutions’ (LSIs, i.e. smaller Italian banks under the Bank of Italy’s supervision) are on average as profitable and marginally less cost efficient than ‘significant institutions’ (SIs, i.e. the 14 largest banks under ECB supervision), while their average capitalisation is higher (Table 4.2.2). However, LSIs overall seem to exhibit larger asset-quality issues (i.e. higher impaired-loan ratios and lower coverage ratios). This might be explained by LSIs’ higher exposure to (riskier) small firms and geographical risk concentration, a lower ability to work out impaired loans due to the lack of critical mass and of specific expertise, but also by their higher degree of loan collateralisation on average. While SIs have been subject to several stress tests and asset-quality reviews, LSIs have so far not been covered to the same extent by such exercises.

Table 4.2.2: Key indicators on the Italian banking sector by segment, Q2 2016

Indicator	SIs	LSIs	LSIs: BCCs	LSIs: non-BCCs
Total assets (EUR billion)	2,304.0	558.0	236.0	323.0
Stock of customer loans (EUR billion)	1,517.4	314.3	133.2	181.1
Stock of non-performing loans (EUR billion)	271.2	63.4	26.4	37.0
Stock of bad loans (EUR billion)	163.2	37.0	14.6	22.4
Non-performing loan ratio	17.9%	20.2%	19.8%	20.4%
Bad loan ratio	10.8%	11.8%	11.0%	12.4%
Non-performing loan coverage ratio	46.6%	43.6%	42.3%	44.5%
Bad loan coverage ratio	58.8%	57.6%	56.1%	58.6%
Loan value adjustments as % of operating income	80.3%	70.8%	95.5%	55.4%
CET 1 ratio (Basel 3 phased-in)	11.7%	15.5%	16.3%	14.9%
Total capital ratio (Basel 3 phased-in)	15.1%	16.6%	16.8%	16.5%
Return on equity (net of goodwill impairments)	2.2%	2.2%	-0.5%	4.6%
Cost-to-income ratio	67.8%	69.9%	68.5%	70.7%

Notes: More information on and a list of SIs is available at <https://www.bankingsupervision.europa.eu/banking/list/wh/o/html/index.en.html>. Non-performing and bad-loan ratio figures are gross of loan-loss provisions.

Source: Bank of Italy

There are some marked differences between the segment of small cooperative banks and medium-sized cooperative banks. One the one hand, compared to the small cooperative banks (*banche di credito cooperativo* (BCCs)), the medium-sized cooperative banks (*banche popolari*) have on average lower capital ratios and a higher proportion of impaired loans. On the other hand, BCCs' revenues have been relatively more affected by the low-interest-rate environment, resulting in negative profitability on average (Table 4.2.2). BCCs' ability to raise new equity from external investors is *inter alia* constrained by their specific cooperative features, which however are supposed to be at least partially addressed by their ongoing corporate governance reform (see 'Corporate governance reforms' in this section).

Several private and public crisis management interventions have taken place in the Italian banking sector since the end of 2015. First, four small banks were resolved in November 2015⁽²³⁾ and split into a common 'bad' bank and four good bridge banks owned by the national resolution authority. In January 2017, the Bank of Italy approved the sale of three of the bridge banks to UBI Banca, whereas the negotiations on the sale of the fourth bank to Banca Popolare dell'Emilia

Romagna are still ongoing. Before being sold, the bridge banks are likely to be recapitalised and undergo a robust balance sheet clean-up. Second, spring 2016 saw the failure of the initial public offering of two medium-sized *popolari* banks (Banca Popolare di Vicenza and Veneto Banca). As a result, the 'Atlante I' fund (a private backstop facility of EUR 4.25 billion funded by contributions from other Italian banks, insurers, bank foundations and *Cassa Depositi e Prestiti*) underwrote both banks' equity issuance for a total of EUR 2.5 billion and thereby ended up owning the entities almost completely. In January 2017, Atlante I injected another EUR 0.9 billion in these banks as part of a further recapitalisation. The two banks were also granted access to a new public liquidity guarantee scheme adopted in December 2016 (following individual Commission decisions). Both banks face at the moment significant legal claims for past malpractices and have gross non-performing loan ratios of just above 30 %.

Banca Monte dei Paschi di Siena (BMPS) announced in December 2016 that its private recapitalisation plan had failed. The EUR 5 billion private recapitalisation coupled with a EUR 28 billion impaired-loan securitisation was triggered by the bank's capital shortfall under the hypothetical adverse scenario of the 2016 EU-wide stress test⁽²⁴⁾ and the non-performing loan reduction targets set by the ECB. Given the impossibility to raise capital on the market, the bank applied for a precautionary recapitalisation by the Italian state. In anticipation of this, in December 2016, the government adopted the framework for setting up a EUR 20 billion fund to be used for precautionary recapitalisations. Solvent banks with a capital shortfall under the adverse scenario of a stress test or equivalent exercise are eligible for this capital strengthening tool, provided all relevant conditions of the Bank Recovery and Resolution Directive are complied with. Precautionary recapitalisations constitute State aid and are available only under specific conditions.⁽²⁵⁾ Furthermore, BMPS was granted

⁽²⁴⁾ <http://www.eba.europa.eu/risk-analysis-and-data/eu-wide-stress-testing/2016>

⁽²⁵⁾ The 'precautionary recapitalisation' is one exception within the Bank Resolution and Recovery Directive (BRRD) to the principle that State aid can be given to a bank only if that bank undergoes resolution (Article 32(4)(d)(iii) of the BRRD). It involves the state injecting capital in a bank

⁽²³⁾ For more details, see European Commission, 2016f.

access to a new public liquidity guarantee scheme adopted in December 2016 (following an individual Commission decision).

Overall, the liquidity situation of the banking sector has remained comfortable. Banks' funding costs have declined further. Resident deposits have continued to grow – offsetting the gradual reduction in non-resident deposits – while funding through wholesale and retail bond issuance has decreased further. From mid-2016, Italian banks' reliance on ECB refinancing rose again to EUR 204 billion (6.5 % of liabilities) in December 2016, mainly replacing more expensive wholesale funding or due to switching from the first to the second round of the ECB's targeted longer-term refinancing operations. In January 2017, the Canadian rating agency 'DBRS' lowered the Italian sovereign's long-term credit rating, which led to an increase in the haircuts applied to Italian marketable securities posted as collateral with the ECB. Consequently, it has become more costly for Italian banks to obtain ECB funding secured by domestic marketable securities.

Despite the generally comfortable funding environment, some vulnerable banks have experienced liquidity pressures. These pressures led to deposit outflows from those banks, while residents' deposits overall continued to grow. To mitigate unwarranted developments in the case of pressure on the liquidity position of banks, in December 2016 the Italian government adopted a scheme to guarantee new bank debt and emergency liquidity assistance by the central bank against a fee. The liquidity scheme was approved by the Commission and is valid until mid-2017.

which has a capital shortfall in the adverse scenario of a stress test or asset-quality review, but which is solvent in the baseline scenario. The aid must be temporary and limited to the shortfall identified under the adverse scenario so that it covers only unlikely (not incurred or likely) losses. Furthermore, three criteria must be satisfied for the Commission to authorise the State aid: (i) the shareholders and subordinated bondholders of an aid-receiving bank contribute to the cost of the bank's failure first to minimise the amount of taxpayer money used ('burden-sharing principle'); (ii) the bank is restructured to ensure its long-term viability; (iii) proportionate measures are applied to remedy competition distortions.

Table 4.2.3: **Bank bonds by seniority, holding sector and size of issuing bank, Q2 2016**

Senior bank bonds (EUR billion)	Top-5 banking groups	Other large banks	Medium-sized banks	Small banks	Total
Held by banks	156.7	18.9	23.6	7.2	206.5
Held by households	77.2	13.3	19.0	46.3	155.7
Held by others	120.3	25.2	12.2	3.7	161.4
Total	354.2	57.5	54.8	57.2	523.6
Subordinated bank bonds (EUR billion)	Top-5 banking groups	Other large banks	Medium-sized banks	Small banks	Total
Held by banks	8.9	0.7	1.0	0.9	11.4
Held by households	16.3	3.2	2.6	3.0	25.2
Held by others	19.0	0.9	1.7	0.7	22.4
Total	44.2	4.8	5.3	4.6	58.9

Notes: Seniority refers to the order of payment in the event a bank cannot longer service all of its liabilities. Senior bonds must be repaid before subordinated bonds.

Source: Bank of Italy

The stock of bank bonds held by retail investors which could be subject to burden-sharing or bail-in is expected to decline further. The majority of banks have stopped selling subordinated bonds to retail investors. Furthermore, targeted information campaigns have increased investors' awareness of the risks associated with these instruments. In Q3 2016, households' holdings of bank bonds had declined to EUR 154 billion from their peak of EUR 393 billion in Q1 2012. In most cases, retail investors have switched to deposits or investment funds, partly encouraged by the increase in the tax rate applied to bank bond returns compared to the more favourable treatment until 2012. In Q2 2016, households still held EUR 25 billion in (the more risky) subordinated bonds (43 % of the total) and EUR 156 billion in senior bonds (30 % of the total) (Table 4.2.3). The five largest banks accounted for just over half of the total amount outstanding. On average, bank bonds account for around 5 % of households' total wealth and are held by only around 5 % of Italian households, which mostly belong to the highest decile of the distribution of financial wealth (Bank of Italy, 2016b).

Retail investors impacted by the mis-selling of bank bonds can claim damages. Following the resolution of four small banks in November 2015, which involved burden-sharing for retail investors holding subordinated bonds, a solidarity fund for granting retail investors compensation was set up and is managed by the deposit guarantee fund for credit institutions (*FITD*). The decree law in question established a compensation procedure for

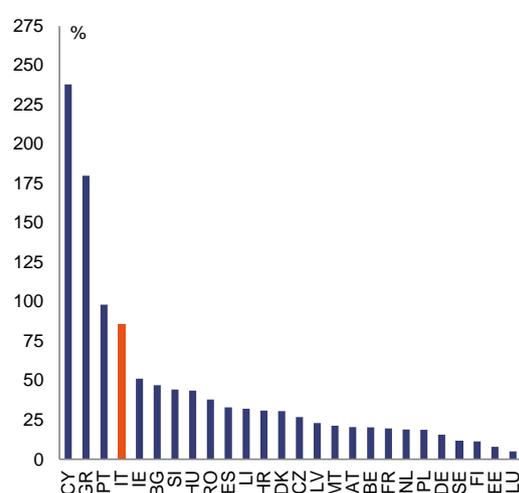

the mis-selling of subordinated bonds issued by the resolved banks. Financially vulnerable retail investors who had acquired their subordinated bonds before 12 June 2014 (the publication date of the EU's Bank Recovery and Resolution Directive) were given access to an accelerated procedure. An alternative arbitration procedure is also envisaged but is not yet operational. Under the accelerated mechanism, by the end of January 2017, 23 % of the some 14 400 claims received by then had been settled, corresponding to payments of EUR 44 million. A compensation mechanism for retail bondholders that were victims of mis-selling is also planned as part of the envisaged precautionary recapitalisation of Banca Monte dei Paschi di Siena.

Impaired asset developments*

The banking sector's non-performing loan problem is systemic and weighs on Italy's economic recovery. The gradual deterioration of loan quality in recent years has affected all parts of the Italian banking sector. The largest banks account for around three quarters of total non-performing loans (NPLs).⁽²⁶⁾ Net of loan-loss provisions, NPLs accounted for 86 % of the banking sector's own funds (Graph 4.2.1). A high NPL stock is a drag on a bank's profit as it generates less interest income, requires loan-loss recognition and increases operating costs related to NPLs' management and work-out. NPLs also hold back the recovery of credit and thereby weigh on investment as they lock in a bank's capital otherwise available for new lending, lead to more conservative lending and raise a bank's cost of funding (IMF, 2015b; Balgova and Plekhanov, 2016). Regarding individual banks, Graph 4.2.2 suggests that low average asset quality appears to be associated with subdued growth in gross customer loans. This weak credit recovery hampers the full transmission of expansionary monetary policy measures to the economy. Finally, problem loans tend to create uncertainty and weigh on investors' and depositors' confidence in the banking sector.

⁽²⁶⁾ In Q2 2016, among Italy's 14 largest banks of which the main activity is traditional deposit-taking and lending, the gross NPL ratio ranged from 6.4 % to 34.9 %, with an average of 18.6 % and a median of 23.3 %. Four banks in the sample had gross NPL ratios above 30 %.

Graph 4.2.1: **Net non-performing debt instruments as % of total own funds for solvency purposes, Q2 2016**

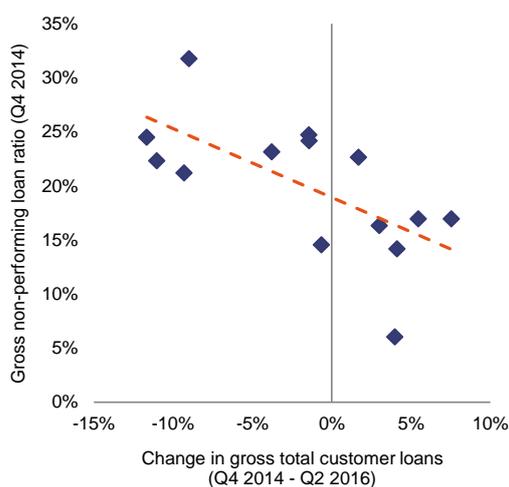

Source: ECB

Some specific features of Italy's NPL stock may reduce recovery prospects. First of all, bad loans – impaired loans with the lowest recovery prospects – represent the bulk of NPLs, i.e. around 60 % of the gross total in Q3 2016 (EUR 197 billion). Unlikely-to-pay loans and past-due loans account for 37 % (EUR 120 billion) and 3 % (EUR 10 billion) respectively. Second, on the sectoral distribution of impaired loans, the non-financial corporate sector accounts for just over 70 % of total gross NPLs (in value terms) and also displays a much higher gross incidence of NPLs (30.2 %) than households (8.6 %) and other sectors (9.1 %). Third, regarding their geographical distribution, gross corporate NPL ratios in the southern and economically more fragile parts of the country are a lot higher (around 40 %) than in northern and central parts (25 % to 35 %). Moreover, the geographical dispersion of NPLs implies that recovery prospects may vary widely. Fourth, the stock of Italian bad loans appears rather fragmented: small bad loans of up to EUR 75 000 account for 74 % of the total number of borrowers for the entire bad loan stock, while representing only 6.7 % of the total value of the entire bad loan stock (Graph 4.2.3). The recovery prospects of such small corporate non-performing exposures – in most cases linked to micro- and small firms – may be constrained by economic and social considerations. Finally, although corporate NPLs exist in all industries and geographical areas, construction features a much higher gross bad-loan

ratio (30.3 %) than industry (13.2 %) or services (16.2 %).

Graph 4.2.2: Relationship between banks' loan growth and asset quality

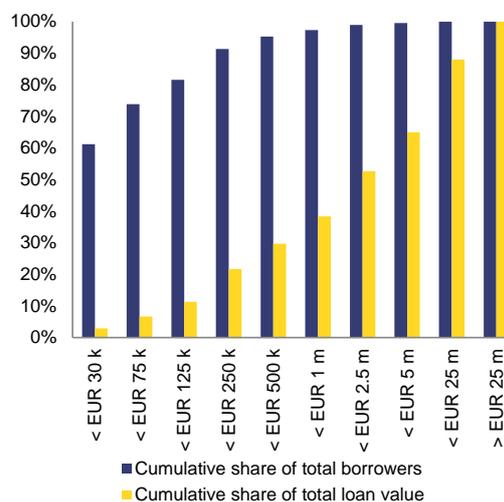

Notes: Each dot represents a single bank. The sample consists of Italy's 14 largest banks of which the main activity is traditional deposit-taking and lending.

Source: European Commission, banks' financial reports

The inflow of new NPLs has slowed down since the beginning of 2015. Italy's gradual economic recovery contributes to the improvement of borrowers' financial situation. For firms, the number of bankruptcies and other insolvency procedures continued to fall in 2016. Together with banks' more conservative lending practices, this has reduced the new NPL rate to 2.6 % in Q3 2016 (from the end-2013 peak of 5.9 %). The new bad-loan rate fell to a lesser extent (to 2.3 % in Q3 2016 from the mid-2013 peak of 3.2 %). This is because loans that are already impaired (i.e. unlikely-to-pay loans and to a lesser extent past-due loans) still migrate to the bad loans category. As bad loans are characterised by a much higher coverage rate (59 % on average in Q2 2016) than unlikely-to-pay loans (28.3 %) and past-due loans (17.7 %), this migration is a continuous source of further provisioning needs. ⁽²⁷⁾

⁽²⁷⁾ The source for all figures in this paragraph is Bank of Italy.

Graph 4.2.3: Cumulative distribution of the Italian bad-loan stock by loan value and number of borrowers, Q3 2016

Source: Bank of Italy

Several factors still prevent the development of a secondary market for impaired assets in Italy.

The pricing gap – defined as the difference between NPLs' net book value on banks' balance sheets and specialised investors' bid prices – is currently estimated at around 20 percentage points. This means that banks would have to book considerable losses when selling NPLs under current market conditions. The pricing gap is driven by several factors: (i) the difficulties which some bank experience in adequately raising NPL coverage ratios given their low profitability; (ii) lengthy and cumbersome insolvency and collateral enforcement procedures, which lower recovery rates and raise recovery costs; (iii) banks' and specialised investors' use of different valuation criteria (e.g. the factor used to discount expected cashflows, the accounting method for indirect costs of problem loan management); (iv) information asymmetries between sellers and buyers of impaired loans, often linked to a lack of granular data on loan portfolios due to inadequate loan management and record-keeping; (v) the underdevelopment of Italy's NPL market itself, resulting in higher liquidity premia and lack of competition which in turn drives up investors' required return rates.

Other factors may also help to explain the modest activity in the Italian secondary market for impaired loans. Some banks may prefer to wait with the disposal of their impaired loans until

the economic recovery and structural reforms improve the recovery prospects of such loans. Some banks might be reluctant to terminate client relationships ('loan evergreening'). Furthermore, the sale of large impaired loan portfolios may have an adverse effect on some parameters of banks' internal ratings models (e.g. the loss-given-default parameter) which determine banks' capital requirements. Moreover, the sale of highly-provisioned NPLs tends to cause a fall in the average coverage ratio which is an element that banks may be reluctant to report, even though average asset quality has improved. Finally, small banks' NPL portfolios may tend to lack critical mass and be insufficiently diversified to attract investors.

NPL market activity in Italy has remained modest. So far, banks have preferred or have been compelled to work out impaired loans internally. Although some banks have taken steps to improve their arrears management capacity, considerable scope remains to further upgrade internal NPL strategies and practices. In the meantime, NPL market activity in Italy continued to be modest. The sale of impaired assets is expected to have reached almost EUR 14 billion in 2016, which means a considerable reduction from the EUR 19 billion of 2015 (PwC, 2016). However, market activity may pick up in 2017 as several large and medium-sized banks are planning to dispose of significant NPL portfolios, including through securitisation. Until now, the sale of impaired loans has mainly been opportunistic and concerned highly provisioned unsecured exposures, which are relatively easy to work out.

Several initiatives were taken to address banks' NPL problem, but as a comprehensive strategy is still missing, short-term relief to the sector has been limited so far. Most of the adopted measures aim to foster the development of a secondary market for distressed assets in Italy. These include (European Commission, 2016f) the removal of tax disincentives to loan-loss provisioning, further reforms of insolvency and collateral enforcement rules and the setting-up of an NPL securitisation scheme backed by state guarantees, provided at 'no-State-aid' terms (GACS) ⁽²⁸⁾. The scheme – for the time being available until October 2017 – allows a bank (or

group of banks) to set up a securitisation vehicle that issues senior-, junior- and optionally also mezzanine-ranked notes to acquire bad loans from that bank. Some banks are expected to make use of the scheme in the future. Although this scheme may help to reduce the NPL pricing gap by lowering funding costs, its effectiveness may be challenged by several factors. Most importantly, the appetite of private investors for a vehicle's riskier non-senior tranches may be limited if banks are unwilling or unable to grant a sufficiently high haircut on their bad loan portfolios. However, this drawback may be partially mitigated by the 'Atlante II' fund (currently having EUR 1.8 billion in resources), which aims to support the disposal of impaired loans, including by investing in non-senior tranches of bad loan securitisation vehicles. ⁽²⁹⁾ Nevertheless, Atlante II may not have the full capacity needed to play a systemic role in the cleaning up of the Italian banking sector. Moreover, similar to Atlante I, the financing structure of Atlante II is a source of interdependencies between stronger and weaker entities. This could lead to contagion if unexpected losses arise from investments. Atlante II has not yet made investments, but is expected to do so in the context of some vulnerable banks' bad loan securitisation operations. Finally, the public EUR 20 billion fund, created to support vulnerable banks and protect savers, may facilitate the cleaning up the Italian banking system.

Supervisors are becoming more assertive on the need for banks to address the NPL problem.

Bank of Italy has issued a new reporting template requiring banks to provide detailed data on their bad loans, collateral and ongoing recovery procedures. This could help banks improve the management of impaired loans, reduce information asymmetries and better inform supervisory action. The ECB has issued guidance to banks on NPLs, which the Bank of Italy intends to also apply to less significant institutions under its own supervision. A stocktaking report accompanying the guidance suggests considerable scope to expand supervisory guidance at national level. Finally, the ECB is raising pressure on more vulnerable banks, e.g. with NPL reduction targets.

Inefficiencies in Italy's insolvency and collateral enforcement frameworks have not been

⁽²⁸⁾ Garanzia sulla cartolarizzazione delle sofferenze

⁽²⁹⁾ EUR 1 billion of Atlante II's capital comes from Atlante I.

overcome yet. Well-designed (pre-)insolvency and foreclosure frameworks are of key importance to preventing the piling up and the working out of NPLs, raising impaired loans' recovery value, developing a secondary market for NPLs, and fostering the reallocation of productive resources. In Italy, however, the multitude and complexity of procedures, and capacity constraints caused by the crisis-driven surge in cases are proving difficult to tackle. For instance, bankruptcy proceedings on average continue to be excessively long (7.4 years over July 2015-June 2016, as against 7.9 years over the previous 12 months), with very large regional disparities. Furthermore, the average time needed to enforce real estate (3.3 years over July 2015-June 2016, as against 3.7 years over the previous 12 months) as well as movable assets (0.5 years over July 2015-June 2016, unchanged from the previous 12 months) remained very long.⁽³⁰⁾ Moreover, creditors' role in insolvency proceedings was still minimal in 2015. At the end of 2014, only 15 % of restructuring procedures were concluded within four years (Bank of Italy, 2016b). These weaknesses are highly relevant given Italian NPLs' significant collateralisation: in Q2 2016, they were secured by real and personal guarantees for 67 % of their total gross amount.

The Italian authorities took further action in 2016, but a systemic overhaul of the insolvency framework is still under debate. In addition to reforms enacted in 2015 (European Commission, 2016f), a new law *inter alia* authorises private enforcement clauses in loan contracts with firms allowing creditors, in the event of a debtor's default, to take ownership of collateral out of court (*pactum marcianum*). This could significantly reduce the time needed to enforce collateral, and lenders may also be able to make use of such a clause when renegotiating already existing loan agreements. The law also enables entrepreneurs to pledge movable assets while continuing to use them (a kind of non-possessory lien). In addition, an electronic register for insolvency cases is being set up, which should enable better monitoring and foster discipline. Although most of the measures taken so far may support a faster disposal of impaired assets, their effects may materialise only in the medium term and in some cases be dependent on improvements in the capacity of the

judicial system. Meanwhile, the 'Rordorf' experts committee has prepared the overhaul of Italy's insolvency framework, leading to a draft enabling law currently under discussion in Parliament. This root-and-branch reform is expected to streamline the insolvency tools and increase specialisation.

Corporate governance reforms*

The implementation of the reforms of *banche popolari* and bank foundations is broadly on track. The implementation of the 2015 reform of large cooperative banks (*banche popolari*) is almost complete: all but two large *popolari* became joint-stock companies. However, Banca Popolare di Sondrio and Banca Popolare di Bari have postponed their conversion in anticipation of a Constitutional Court ruling following legal challenges against the reform's restriction on shareholders' withdrawal rights. Furthermore, a first merger (between Banco Popolare and Banca Popolare di Milano) became effective at the beginning of 2017, after the former raised an additional EUR 1 billion capital upon supervisory request. On bank foundations, the implementation of the Memorandum of Understanding with the Ministry of Economy and Finance is ongoing: almost all foundations have complied with the April 2016 deadline to align their statutes with the memorandum, but divestments from reference banks have incurred a delay due to unfavourable market conditions. In October 2016, one third of foundations had divested in line with the requirements of the memorandum. Half of the remaining foundations were still above the requested thresholds, albeit by small amounts.

The implementation of the self-reform of small cooperative banks has started. With the adoption of the primary law in April 2016 and the Bank of Italy's secondary provisions in November 2016, the 18-month implementation period for the reform of Italy's *banche di credito cooperativo* (BCCs) has started. The reform obliges BCCs to join a cooperative banking group (which can be either national or provincial) in order to retain their cooperative status. The holding of a group should be a joint-stock company and will have the power to direct and coordinate member BCCs on the basis of risk-based 'cohesion contracts'. Holding groups must meet certain minimum capital requirements and have an internal safety net provided by a cross-guarantee between cooperative

⁽³⁰⁾ The source for all figures on the length of proceedings is the Italian Ministry of Justice.

banks inside the same group. The Bank of Italy has asked entities envisaging to become the holding of a group to announce their intention by the end of January 2017. The BCCs' shareholders have to decide which group they would like to join when they adopt their banks' 2016 financial statements. It is currently expected that up to two national and one provincial cooperative banking groups may be set up. Cooperative groups reaching 'significant institution' status will be directly supervised by the ECB and will therefore be subject to a prior stress test and asset-quality review. If successfully implemented, the reform should make the BCC segment more resilient due to easier access to capital markets, cross-guarantees, benefits of scale and cost synergies. It would also be a big step forward in reducing banking sector fragmentation.

Reductions in the size of banks' management boards have been made at a slow pace. As part of a broad corporate governance reform in 2014, the Bank of Italy set stricter requirements on the composition and size of bank boards and the role of a board's chairperson as non-executive director, as well as guidance for boards' self-assessment to strengthen risk management and internal controls. While banks have implemented most of these changes, the reduction in the number of board members is proceeding slowly. According to Bank of Italy, the average size of managing boards for listed banks is currently 12.9 (compared to 14.1 two years ago). However, Italian banks – including those under ECB supervision – still have larger boards of directors as compared with European peers. Furthermore, some credit institutions have a dual board system and the move towards a single board system appears to be limited.

4.3. LABOUR MARKET, EDUCATION AND SOCIAL POLICIES

4.3.1. LABOUR MARKET*

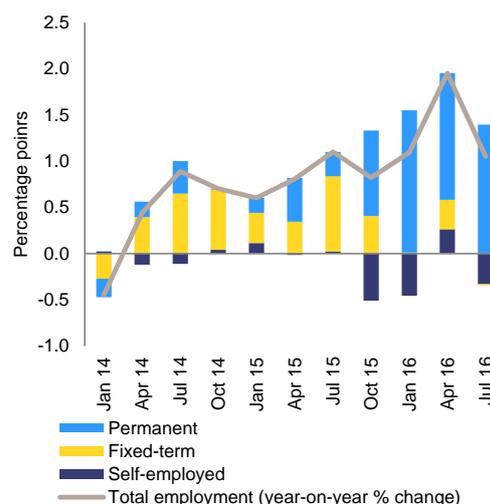

The Jobs Act and its impact

Italian labour market institutions have been deeply reformed over the last two years. The enabling law for the reform of the labour market ('Jobs Act') was adopted at the end of 2014. All implementing legislative decrees were adopted in 2015. The Jobs Act reduced the cost and the uncertainty of individual dismissals, rationalised contractual forms and passive policies (including wage supplementation schemes) and initiated a broad reform of active labour market policies, bringing the Italian labour market closer to the labour flexicurity model. It also reduced administrative costs for firms, streamlined inspection activities and included measures to promote the balance between work and family life. The objective was to improve the entry and exit flexibility, enhance labour reallocation, reduce duality and promote stable open-ended employment. To support the reform, the government enacted generous fiscal incentives for permanent new hires in 2015 and 2016. For 2017, incentives are targeted to young people and workers in the south (European Commission, 2015a; European Commission, 2016b).

Positive effects are already emerging, as employment is growing and dualism is reducing. ⁽³¹⁾ Employment started to pick up in the second half of 2014 and accelerated in 2015, but remains far from the 67-69 % Europe 2020 national target. While in 2014 temporary employment was the main contributor to employment growth, since Q2 2015, permanent employment has become the main driver (Graph 4.3.1). In 2016, in spite of a substantial reduction in hiring subsidies (from 100 % of social security contributions to 40 %), dependent employment continued to expand. Administrative data from INPS and the Ministry of Labour confirm that the number of new hires on open-ended contracts increased significantly in 2015 relative to 2014. However, as fiscal incentives were scaled down, in between January and August 2016, the number of new hires with open-ended contracts was lower than the number of new hires on fixed-term

contracts. At the same time, the rate of conversion from fixed-term to open-ended contracts remained higher in 2016 than in 2013-2014, suggesting that the reform is having a lasting impact.

Remaining challenges

Collective bargaining

Italy's collective bargaining suffers from several shortcomings. Firm-level contracts concern a minority of firms. This limited use of firm-level bargaining hampers the response of wages to economic conditions, the efficient allocation of resources and the development of innovative solutions at firm level that could improve productivity. This is also due to some specific features of the collective bargaining framework, which entail uncertainty in industrial relations and reduce the scope for firm-level negotiations. These features were described in European Commission, 2016b, Box 2.4.1.

Contracts are renewed sector-by-sector, but no progress is made in reforming the collective bargaining framework. The rules currently regulating collective bargaining were agreed in 2009 and formally expired in 2013, but social partners repeatedly postponed an agreement on a new framework. In December 2016, the largest employer association and trade unions started preliminary discussion on the bargaining

⁽³¹⁾ Labour market 'dualism' refers to the division of the labour market into two different segments, usually temporary contracts and permanent contracts.

framework. Negotiations are now taking place on a sector-by-sector basis. Current negotiations between trade unions and employers' organisations focus mainly on how to adjust salaries to price inflation. Another aspect is the possibility to include welfare provisions (e.g. childcare, additional social security) in second-level bargaining, possibly instead of wage increases. The metal sector agreement for 2016-2019, signed by the social partners in November 2016 after long negotiations, includes these elements.

The agreement on trade union representativeness, a prerequisite for the decentralisation of collective bargaining, has not yet been implemented. In 2014, the three main trade unions and Confindustria agreed on the criteria for measuring trade union representativeness, a prerequisite for having legal certainty about the validity and enforceability of contracts at firm, local and national level. Although similar agreements have been signed with other employers' associations, none of them is operational yet but negotiations are progressing. The application of the agreed criteria will resolve the uncertainty linked to workers' representation and the relationship between different bargaining levels, which is a major obstacle to establishing binding agreements at firm and local level.

The impact of tax incentives on productivity-related wages to foster second-level bargaining has not yet been assessed. To foster the decentralisation of wage bargaining, the 2017 Budget Law strengthened the tax rebates on productivity-related wage increases introduced in 2016. Waived fiscal revenues are estimated to increase gradually to nearly EUR 1 billion per year in 2019. Effective monitoring of the actual impact on firms' internal organisation and salary policies will be crucial to avoid that the scheme is used only to benefit from lower contributions and higher net salaries.

Labour participation of second earners

The potential of female labour market participation remains largely underutilised. The employment rate of women remains very low (50.6 % for those aged 20-64 years, 20 percentage points less than for men), as does the female activity rate (54.1 % in 2015, as against an EU average of 66.8 %). This results in a large

economic cost, also when considering that women have relatively higher educational attainment rates than men. Available estimates suggest that increasing women's labour market participation to the level of men would increase Italy's GDP by 15 % (IMF, 2016; Eurofound, 2016).

The tax system continues to discourage second earners from participating in the labour force.

In Italy, the financial disincentives to move from inactivity and social assistance to employment ('inactivity trap') are above the EU average and growing. A second earner taking up a job with a wage equivalent to 67 % of the average wage would find nearly 31 % of this wage taxed away through the combination of taxes, social security contributions and reduced social transfers. This compares with 30.5 % in 2014 and 30 % on average in the EU. The high inactivity trap can be explained by the steep progressivity of income taxes, the tax credits for the not-employed spouse and tax credits and/or cash transfers for dependent children (Colonna and Marcassa, 2015).

Access to affordable childcare remains limited, with wide regional disparities.

The employment gender gap⁽³²⁾ widens very significantly when households include children and elderly persons.⁽³³⁾ Besides, female labour force participation is highly sensitive to childcare costs and the effects are particularly pronounced for married and less-educated women, who are also those more likely to face higher inactivity traps. This suggests that access to affordable care for children and the elderly is essential to raise female participation. Yet, around 25 % of children are covered by public childcare in the north, where there is nevertheless unmet demand, and only 5 % in the south.

Cash allowances may have negative consequences for labour participation.

Given the shortage in the supply of childcare, childcare subsidies in cash may create disincentives for women to work. However, policy action has been centred on cash allowances. An allowance of EUR 80 per month for three years was introduced in

⁽³²⁾ The employment gender gap is the difference between the employment rate among men and that among women.

⁽³³⁾ The gender gap is over 20 percentage points for women with one child, 30 percentage points for those with two children and nearly 40 percentage points for those with three children.

2015 for children born or adopted in 2015-2017. The budgetary impact is over EUR 1 billion per year in 2017 and 2018 but the effectiveness of the measure is unclear. Law 92/2012 introduced the possibility of exchanging the parental leave with babysitting vouchers, to be re-financed every year. Take-up was limited at first, but in 2016 the measure was very successful and the budgetary allocation was entirely spent by August. The 2017 Budget Law extends this possibility to 2017 and 2018. The law also introduces from 2017 a non-means-tested voucher of EUR 1 000 per year to be spent in public or private nurseries.

Paternity leave is among the shortest in Europe.

Paternity leave in Italy is two days, one of which is paid in full. The 2017 Budget Law extends the paternity leave to four days from 2018. This limited paternity leave has effects on women's employment and on gender equality, both on the supply side (in terms of the number of women looking for a job) and the demand side (the perception that the costs of child-caring are associated only with mothers).

Active labour market policies

The implementation of the active labour market policy (ALMP) reform is still in an early stage.

The placement capacity of Italian employment services and the expenditure on activation measures are well below the OECD average (Graph 4.3.2). The Jobs Act aims to strengthen the capacity and effectiveness of employment services while tackling the longstanding weaknesses of the system (e.g. understaffed public employment services, the lack of an information infrastructure, fragmented monitoring, regional disparities) (European Commission, 2016b). However, so far only the initial steps have been taken. The non-adoption of the envisaged constitutional reform, which sought to give central government exclusive competence for ALMPs, may represent an additional implementation challenge.

The reorganisation of ALMP governance has started. The new Agency for Active Labour Market Policies (ANPAL) has been operational since January 2017.⁽³⁴⁾ It is in charge of

⁽³⁴⁾ Staff will be made up of around 200 people, half from the Ministry of Labour and half from INAPP, a public research centre on labour and social issues. The agency will also be

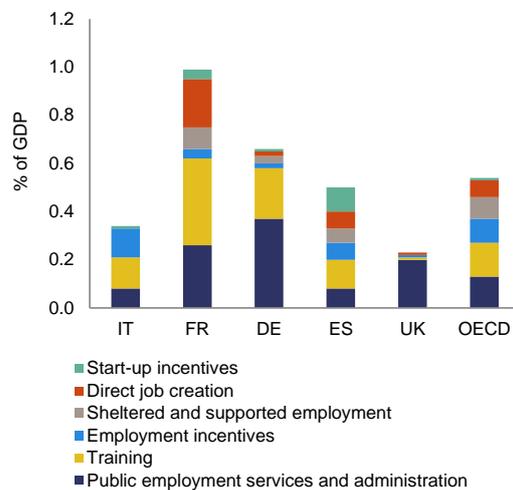

coordinating and monitoring a wide network of institutions and agencies involved in labour policies.⁽³⁵⁾ The objective is to enhance policy consistency and improve the effectiveness of ALMPs throughout the country. The agency is preparing a strategic plan on ALMP (*Piano per le Politiche Attive*), which includes support from the 2014-2020 European Social Fund (EUR 6.7 billion). The plan aims to strengthen public employment services, also through staff hiring and training. A unified information platform and a national accreditation system of employment services and agencies will be created. This would replace regional systems, which are not yet functioning properly everywhere. The agency will determine standard measures and costs for all regions, and indicators are envisaged for evaluating the performance of employment agencies. The Conference of the State and the Regions has reached an agreement for the finalisation of the plan.

Support for jobseekers is being modernised and an outplacement voucher has been launched on an experimental basis.

A customised service agreement (*patto di servizio personalizzato*) is envisaged, to be agreed between the employment agency and the jobseeker. The agreement will commit the former to provide a range of opportunities tailored to her/his specific needs and the latter to accept them, if appropriate. The take-up of activation measures is needed for receiving the benefits and penalties are applied if the jobseeker does not comply. An outplacement voucher (*assegno di ricollocazione*) pilot was launched in November 2016. The voucher can be used to pay for public or (authorised) private employment services. Its value is proportionate to the person's employability, based on observable factors (e.g. employment history, gender, age). It is paid only upon job placement.

able to coordinate *Italia Lavoro*, a state-owned enterprise with some 1 000 staff.
⁽³⁵⁾ The network includes the national social security institute (*Istituto Nazionale per la Previdenza Sociale (INPS)*), the national insurance institute for employment injuries (*Istituto Nazionale Assicurazione Incidenti sul Lavoro (INAIL)*), the national institute for policy evaluation (*Istituto Nazionale per l'Analisi delle Politiche Pubbliche (INAPP)*), regional services, labour agencies, and bilateral and professional funds.

Graph 4.3.2: Public expenditure on labour market policies, 2014

Source: OECD

After a slow start in 2014, the implementation of the Youth Guarantee has progressed significantly since 2015. In Italy, the Youth Guarantee is funded mainly through the national *Iniziativa Occupazione Giovani* operational programme (EUR 1.5 billion). In December 2016, more than 1.1 million young people were registered and almost 800 000 signed an ‘activation pact’. Over 400 000 measures have been delivered to the participants, almost half consisting of traineeships (Ministry of Labour, 2017).⁽³⁶⁾ Nearly 35 % of those who completed a Youth Employment Initiative operation were employed four weeks later and the percentage increases to nearly 43 % after six months (INAPP, 2016). In 2015, two new measures were introduced: the ‘Superbonus’ (for employers hiring young people who participated in a relevant traineeship) and the ‘Selfemployment’ (micro-credit and subsidised loans to support self-employment). In the first four months of the former, 5 412 job contracts were signed (2 020 permanent contracts and 3 392 apprenticeship contracts) (Ministry of Labour, 2016a). Further improvements are the outreach to non-registered young people neither in employment nor in education or training, the use of standardised profiling, individual support for young people and the take-up of key measures such as traineeships and specialised training courses.

⁽³⁶⁾ Under Italy’s Youth Guarantee implementation scheme, a participant can benefit from more than one measure.

Some challenges remain to ensure the full implementation of the Youth Guarantee scheme. The number and quality of offers remain low and regional differences in the delivery of the guarantee remain high. The quality of vocational education, including apprenticeships, is still limited (see Section 4.3.3). Regional and national monitoring systems on the implementation of the scheme are still to be further integrated and harmonised. Engaging the most vulnerable and disengaged young people not registered for the programme remains a challenge.

Refugees show relatively high employment rates, but current high inflows are a challenge.

In 2014, the employment rate of refugees (aged 20-64) was 61.3 %, exceeding the employment rate of native born in general (59.7%), but below the employment rate of native born men (69.3%), a more valid point of comparison considering the high share of men among refugees. Asylum seekers are entitled to personalised integration support (e.g. language training, ten hours of adult education per week and civic integration classes). However, only about a fourth of asylum seekers took up integration support in 2014 (OECD, 2016b). Addressing the challenge will require further social and labour market integration efforts.

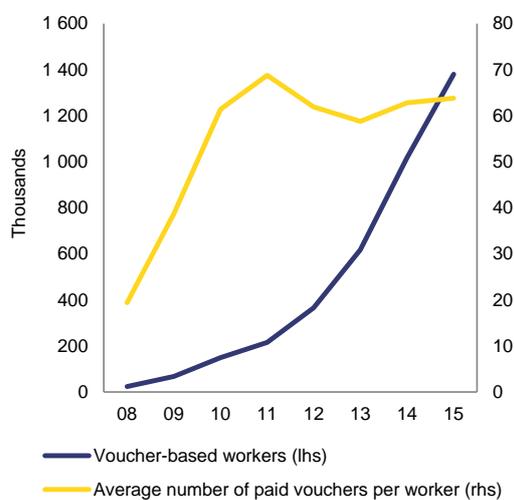

Undeclared work

Inspection activity is strengthened but the incidence of undeclared work remains high. In 2014, the irregularity rate (the ratio of irregular employment in full-time equivalents to total employment in full-time equivalents) grew by 0.7 percentage points compared to 2013, reaching 15.7 % (Istat, 2016a). Undeclared work continues to show strong regional and sectoral differences (European Commission, 2016b). The Jobs Act established a new national labour inspection agency (*Ispettorato Nazionale del Lavoro (INL)*), simplified inspection activities and strengthened monitoring activities, including by rationalising the use of technical and financial resources.

Voucher-based work was introduced in 2003 and has been growing steadily, but the impact on undeclared work seems uneven across sectors. The aim was to promote the regularisation of occasional activities and to foster employment opportunities for students, inactive people and older people interested in short-term and casual

jobs. Limits to their use were relaxed in 2012, 2013 and finally in 2015. The take-up of vouchers has been increasing steadily since 2012. In 2015, voucher-based work involved more than 1.3 million workers, 136 % more than in 2014 (Graph 4.3.3), although it still represents only 0.23 % of the total cost of labour (INPS, 2016). Vouchers are increasingly used by younger workers (the average age declined from 59.8 to 35.9 years over 2008-2015) and women (the proportion of whom increased from 21.5 % in 2008 to 51.5 % in 2015). Figures for 2015 show a predominant use in northern regions and in certain service sectors (Ministry of Labour, 2016b). Vouchers are used less in agricultural and domestic services, which are often characterised by a high prevalence of undeclared work. To address the issue of undeclared work and labour exploitation in the agricultural sector, a law adopted in October 2016 strengthens civil and criminal procedures and monitoring activities.

Graph 4.3.3: Voucher-based workers and average number of paid vouchers per worker, 2008-2015

Source: INPS

Labour market traps are starting to appear as a side-effect of vouchers. Some 49 % of voucher-based workers employed in 2015 were employed under the same status in the previous year and 25-30 % of those employed in 2012-2013 were still employed under the same arrangements in 2015 (INPS, 2016). Some 10 % of voucher-based workers employed in 2015 (about 140 000 workers) had previously had a regular or atypical employment contract with the same employer

(Ministry of Labour, 2016b). Overall, while the use of vouchers can bring more people into the labour market, the impact of vouchers on actual working conditions and social security protection is yet to be assessed. A comprehensive strategy to address the causes of undeclared work is missing.

4.3.2. SOCIAL POLICIES

Poverty rates in Italy are high and rising, especially for children. In 2015, the at-risk-of-poverty-or-social-exclusion rate rose slightly to 28.7 % (17.5 million people) and remains well above the EU average (23.7 %). The risk of poverty for children has been growing faster than for the population in general, while it is declining in the EU as a whole. A third of Italian children are now at risk of poverty or social exclusion, which is among the highest rates in the EU. The recent influx of migrants, including many vulnerable women and minors, is likely to exacerbate this problem. As poverty is rising, people with lower incomes face difficulties in accessing affordable houses, in particular in big cities. There were some 650 000 families on waiting lists for social housing and over 50 000 homeless people were recorded (HE, 2015; ISTAT, 2014).

In-work poverty is higher for temporary workers. In 2015, 16.7 % of population in employment was at risk of poverty or social exclusion (EU average: 12.5 %). Being employed reduces poverty risk by 39 % in Italy (45 % in the EU as a whole). Italian workers on temporary contracts faced one of the highest poverty risks in the EU. This raises the importance of improving labour market functioning and reducing duality, the key Jobs Act aims. The skills distribution may also play a role. Italy has one of the highest shares of low-skilled workers in the EU.

The risk of poverty or social exclusion is higher for people from a migrant background. In 2015, 47.7 % of non-EU-born people over 18 were assessed to be at risk of poverty or social exclusion (25.7 % of native-born people). The share of non-EU-born people over 18 facing severe material deprivation was more than double that of native-born people (23.9 %, as against 10 %). This represents one of the highest gaps in the EU. The 'in-work at-risk-of-poverty' rate among non-EU-born people (over 18 years old) was 26.7 %,

(9.1 % for native-born people). As the employment rate of non-EU-born people is quite high (60.6 %), the high in-work poverty rate may be explained by the high concentration of non-EU-born people in low-skilled jobs and their over-representation in temporary or informal employment.

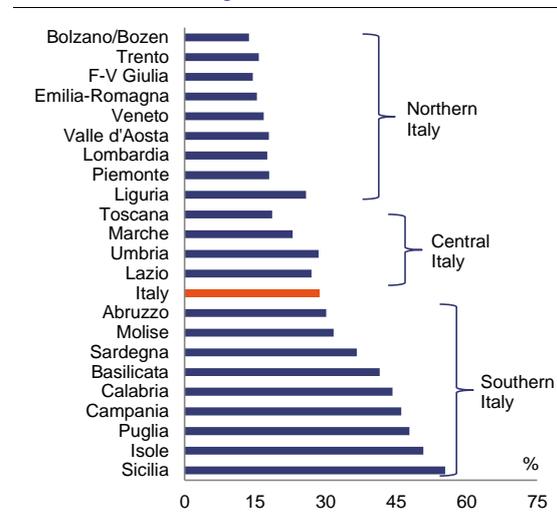

The increase of migrants entering the country irregularly poses challenges to reception and integration. The number of irregular migrants has increased, and those coming from countries with lower asylum recognition rates are overrepresented (see Section 1). This implies a need to ensure the return for those who did not receive protection and to provide for integration measures for those who received protection. There are challenges in ensuring cooperation between the different administrative levels involved in the management of reception, embodied in the ‘System for Protection of Asylum Seekers and Refugees’ (SPRAR). The distribution of asylum seekers and refugees is a source of discussion between the National Association of Italian Municipalities (ANCI) and the Interior Ministry. Italian authorities estimate the budgetary costs due to the migration influx at around 0.2 % of GDP in 2016. A new national ‘reception plan’ was introduced. To accompany the scheme, additional EUR 100 million were allocated to grant municipalities up to EUR 500 for each refugee they agree to accommodate.

The national poverty figures mask a wide north-south divide. Some of the regions in the north (Graph 4.3.4) have among the lowest poverty rates in the EU (e.g. Provincia Autonoma di Bolzano/Bozen). Conversely, poverty is high and widespread in the south (e.g. Sicily). The varying quality and adequacy of social services across the regions partly explain these differences. Italy is one of two Member States which does not have a national minimum income system and the social policy framework is very fragmented. Excluding pensions, social transfers reduce the number of people at risk of poverty and social exclusion by 21.7 % (33.2 % in the EU as a whole).

Experimental measures to address poverty were reinforced in 2016. The ‘Support for Active Inclusion’ (SIA) was extended to the whole national territory. This means-tested benefit is targeted at low-income households that meet certain criteria. The economic support is also

conditional on participation in multidimensional activation programmes tailored to the specific needs of the beneficiaries. The scheme benefits from the support of the European Structural and Investment Funds, particularly to increase the availability and efficiency of social services involved in care projects. The implementation started in September 2016 with an initial budget of EUR 750 million.

Graph 4.3.4: **People at risk of poverty or social exclusion by NUTS 2 region, 2015**

Source: Eurostat

The new ‘Inclusion Income’ scheme is a start to tackle the rise in poverty. Building on the SIA, the new ‘Inclusion Income’ scheme (*reddito di inclusione*) will define a basic level of social benefits guaranteed nationwide. The draft legislation is currently discussed in Senate. Once adopted, it will need further legislative implementing decrees. It is unclear whether the financial resources (around EUR 1.7 billion, after the recent increase) will be sufficient to address Italy’s poverty challenge. The measures on pensions introduced in the 2017 Budget Law (see Section 4.1) confirm the persistent bias of social expenditure towards pensions.

The streamlining of social spending does not go as far as initially envisaged. Two social assistance schemes (*carta sociale* and *assegno di disoccupazione (ASDI)*) will be absorbed into the ‘Inclusion Income’. However, some schemes will remain, notably those for the elderly population, those in support of parenthood and those linked to

disability and invalidity. This fragmentation may make the system unclear and harder to access.

Health outcomes and quality of care are generally good. Health outcome indicators such as life expectancy and healthy life years have been consistently above the EU average in recent years. Overall, public health expenditure, though rising, is below the EU average, which suggests that the Italian healthcare system is cost-effective. Expenditure on pharmaceuticals has risen recently in line with the cost of medical innovations, though it may be moderated by payback schemes in place. E-health systems are being developed, as are information and monitoring systems in support of performance assessment.

However, interregional inequities persist and income-related disparities in access to care seem to be rising. The proportion of people reporting that they could not afford a necessary medical examination increased from 5.1 % in 2011 to 6.2 % in 2014 and the proportion reporting that they did not take a necessary medical examination because of excessive waiting lists is above the EU average. Income-related disparities in self-reported health status are also on the rise. Out-of-pocket payments on health as a proportion of total health expenditure have increased slightly. The number of hospital beds per 100 000 inhabitants is below the EU average. While the number of physicians per 100 000 inhabitants is above the EU average, the ratio of nurses to physicians is among the lowest in the EU. Disparities persist in the extent and quality of healthcare provision across regions.

4.3.3. EDUCATION AND SKILLS*

School education in Italy produces mixed outcomes in terms of basic skills attainment. In 2015, Italy again recorded diverging results in the OECD Programme for International Student Assessment (*PISA*). Overall, the proportion of low achievers is close to the EU average in reading (21 %) and maths (23 %), and somewhat higher in science (23 %). However, performance is above the EU average in the north and significantly worse in the south. Compared with 2012, performance remained broadly stable in maths and reading, but worsened in science (OECD, 2016c; European Commission, 2016g).

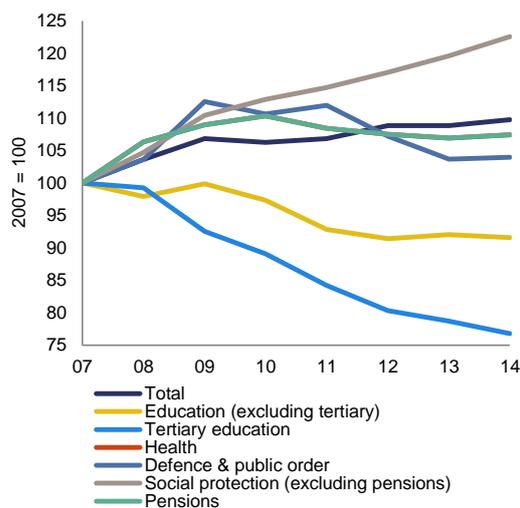

Non-EU born students are at high risk of leaving school early. The early school leaving rate for non-EU born was 33 % in 2015, considerably above that of native born (12.7 %), among the highest gap in the EU. The 2015 school reform included some new measures to promote the integration of migrant pupils. They are not tailored to asylum-seekers, but cover non-Italian students in general. The Ministry has provided schools with proposals and guidelines on how to deal with the 10 most common critical issues they face as regards the inclusion of migrant students. Teachers specialised in teaching Italian to migrant students are being recruited for the first time in the 2016 open competition for permanent posts. This is expected to be the practice in future open competitions as well. Although the performance gap between the native population and first-generation immigrants is quite large, second-generation immigrants are catching up (OECD, 2016b; European Commission, 2016g).

Italy is implementing the 2015 school reform, which is expected to improve school outcomes (European Commission, 2015c). School heads have greater autonomy in managing human, technological and financial resources and will be subject to external evaluation every year from 2016-2017. The success of this measure will depend on the proper implementation of this evaluation system. Approximately 90 000 teachers who had been employed on short-term contracts were recruited on a permanent basis in 2015-2016. While around 45 % filled existing positions, the others took up new posts. The recruitment plan was intended to address the longstanding problem of qualified teachers on 'waiting lists' being recurrently recruited on a temporary basis and to strengthen schools' educational provision. Overall it is a positive measure. However, in the initial implementation phase, the competences of the additional teachers have not always matched individual schools' needs (European Commission, 2016h). A new open competition to recruit up to around 64 000 teachers on a permanent basis was held and a national plan for teacher training and professional development was launched in 2016. This could lead to a better matching of teacher supply and demand.

The higher education system is underfunded. Despite being close to the national Europe 2020 target (26-27 %), Italy's tertiary educational

attainment rate is still the lowest in the EU, at 25.3 % in 2015 for 30-34 year-olds (the rate is 38.7 % for the EU as a whole). At only 0.3 % of GDP, general government expenditure on higher education was the lowest in the EU in 2014, partly due to large funding cuts during the economic crisis (Graph 4.3.5), which coincided with a partial freeze on recruitment. This resulted in an increase in the average age of academics (ANVUR, 2016). Student support is low. Only 9 % of first-cycle students receive a public grant, one of the lowest proportions in the EU (European Commission, 2016i). A fifth of eligible students do not receive a grant due to a lack of funding (Ministry of Education, 2016).

Graph 4.3.5: General government nominal expenditure by function, 2007-2014

Source: Eurostat, COFOG

Recent measures on higher education, albeit partial, are aimed at addressing staff and student support issues, and rewarding research performance. The 2016 Stability Law provided funding for hiring new full and associate professors (*Giulio Natta* chairs), albeit through an ad-hoc procedure, and for 861 young researchers on ‘tenure-track’ positions (1.6 % of Universities’ teaching staff in 2015). The 2017 Budget Law increases public financial support for tertiary students. Public funding for universities has increased significantly and better linked to performance. All these measures are positive partial steps, as they signal an attempt to reverse previous staff and funding policies. However, they

are not sufficient to solve the issues of ageing teaching staff and inadequate spending.

Apprenticeships and work-based learning are being strengthened to improve the labour-market relevance of education. Measures are being taken to increase the learning and qualifications component of apprenticeships, and to attract more youngsters to these paths. An ongoing national pilot initiative for 15-25 year-old students involves 300 vocational training centres throughout Italy. Learning standards have been agreed at national level and funding has been set aside. To strengthen work-based learning, all students in the last three years of upper secondary education are now required to do a traineeship or apprenticeship. This is an ambitious measure to help to equip a new generation with relevant skills. The quality of work-based learning, the engagement of private enterprises and the monitoring of progress and effects are crucial.

Adult learning is not sufficiently developed. The unemployment rate for low-skilled workers was 15.3 % in 2015, more than double the unemployment rate for the high-skilled (7.2 %). Educational attainment levels among 25-64 year-olds are low compared to the European average. They improved between 2010 and 2015, but at a slightly slower rate than in the rest of Europe. The proportion of low-qualified adults in Italy is nearly double that in the rest of Europe. The rate of participation in adult learning is one of the lowest in Europe (2 % in 2015).

The policy framework for adult learning is not yet complete. The fragmentation of the Italian system of adult learning makes it difficult to identify a comprehensive lifelong-learning strategy. A decree laying down general rules on the national system for competence certification was adopted in 2013, but implementation proceeds only slowly. The national qualification system, including the repertoire of apprenticeship professional profiles, is not yet finalised. This should create the basis for the uniform recognition and validation of prior learning across the country, thus offering flexible solutions for further training. The systems for monitoring and evaluating adult learning programmes are underdeveloped and rely mainly on *ex ante* accreditation measures.

4.4. INVESTMENT

Recent trends*

During the crisis, investment in Italy fell more rapidly than in most other Member States. Until 2007, Italy's total investment as a share of GDP was broadly in line with the euro area average (21.6 % as against 23.2 % in 2007). However, its contribution to total factor productivity growth was impaired by inefficient allocation in the economy (European Commission, 2016b). With the crisis, investment as a share of GDP fell to 16.6 % of GDP in 2015, around 3 percentage points below the euro area average (Graph 4.4.1). In real terms, this means that total investment is around 30 % lower than in 2007, at its lowest level since the mid-1990s. While allocation has started to improve somewhat, the low level of investment is now holding back potential growth (see Section 1).

The subdued investment dynamics concern both the private and public sector. Private investment declined from 18.7 % of GDP in 2007 to 14.4 % in 2015, while public investment fell from 3.2 % of GDP on average in 2005-2009 to 2.2 % in 2015. In the private sector, investment by non-financial corporations as a share of GDP dropped from 10.7 % in 2007 to 8.6 % in 2015. In the same period, investment by households declined to 5.5 % of GDP (from 7.7 %). Foreign direct investment in Italy – historically low compared to peer countries – has fallen further after the crisis. Foreign direct investment inflows in 2015 were 52% lower than in 2007, while for the EU as a whole they dropped by 42%.

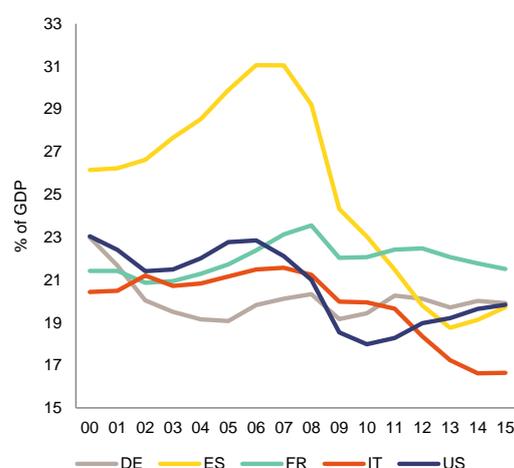

All investment assets were affected, but productive investment fell to a greater extent in Italy than in the rest of the euro area. The drop in residential construction as a share of GDP between 2008 and 2015 was broadly in line with the euro area average (Graph 4.4.2). However, in the same period, non-residential construction investment in Italy fell by 1.9 percentage points of GDP (as against 1.2 percentage points in the rest of the euro area) and investment in machinery and equipment by 1.4 percentage points of GDP (as against 1 percentage point in the rest of the euro area).

Investment in intangible assets⁽³⁷⁾ showed greater resilience, but Italy still lags behind

⁽³⁷⁾ Intellectual property products (ESA 2010 definition)

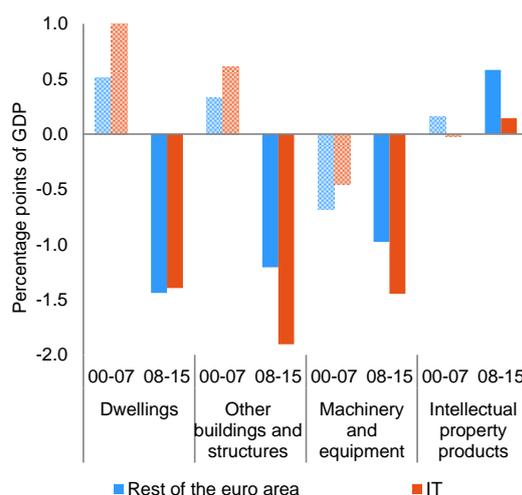

peer countries. Investment in intellectual property products has increased by 0.1 percentage points since 2008, much less than in the rest of the euro area, where it increased by 0.6 percentage points. (Graph 4.4.2). Furthermore, this type of investment represented only 2.7 % of GDP in 2015 in Italy, around 1.5 percentage points less than in the rest of the euro area.

Graph 4.4.1: Investment, current prices

Source: European Commission

Graph 4.4.2: Change in investment by type of asset, current prices

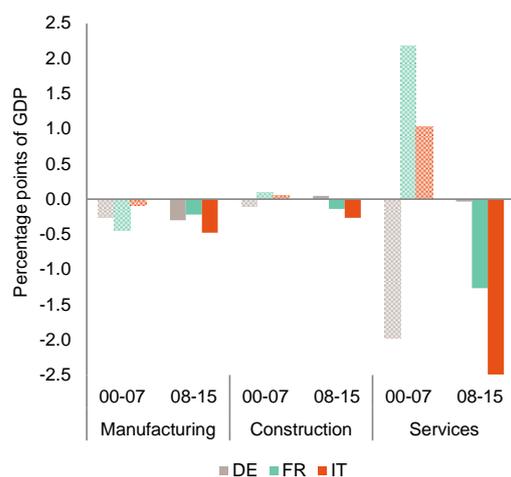

Source: European Commission

Italy's decline in investment is broad-based across industries, but particularly strong in services. Compared with 2008, investment in services in 2015 declined by 2.5 percentage points of GDP, i.e. more than in France, while in

Germany it was broadly stable. Investment in manufacturing and construction fell to a greater extent than in Germany and France (Graph 4.4.3).

Graph 4.4.3: Investment by macro-sector, current prices

Source: European Commission, Istat

Barriers to investment*

Weak demand, uncertainty, still-tight financing conditions and squeezed profit margins are among the factors holding back a broad-based recovery of investment. As in other countries, demand conditions and uncertainty appear to be the main drivers of Italy's large decline in private-sector non-residential investment (Busetti et al., 2015; IMF, 2015a). Financing conditions seem to have played a larger role in Italy than in other countries (IMF, 2015a). Some research shows that while in Spain the restoration of healthy profit margins underpinned a solid recovery of investment from 2013, this was not the case in Italy (Fortin et al., 2015). Looking forward, uncertainty may continue to hold back investment. At the same time, the banking sector's weak profit-generating capacity and high stock of non-performing loans constrain banks' capacity to provide loans, especially towards small firms and specific sectors (see Section 4.2). Such barriers also hinder foreign direct investment.

Structural weaknesses, while gradually being addressed, continue to hinder investment. An inefficient public administration (see Section 4.6.1), lengthy judicial proceedings (see Section 4.6.2) and a difficult business environment (see

Section 4.5.2) are among Italy's long-standing structural weaknesses. In addition, the limited development of capital markets in comparison with other advanced economies makes financing, particularly for smaller firms, largely dependent on bank lending (European Commission, 2016b). These enduring weaknesses, of which the impact on businesses is difficult to assess, may have contributed to the inefficient allocation of investment before the crisis and may deter its recovery now. Moreover, much-needed investments from the European Structural and Investment Funds for 2014-2020 are being carried out only slowly, in particular in many southern regions, with project selection rates reported at 14 % overall at end-October 2016. Certain regions could benefit significantly from structural funds. For example, Sicily is planned to receive EUR 3.4 billion from the European Regional Development Fund for the period 2014-2020.

The government announced several measures to support investment. The 2017 Budget Law confirmed the possibility for companies to deduct 140 % of the amount spent on investment and introduced a new *iperammortamento* rate of 250 % for digital investments as part of the new 'Industry 4.0' strategy (see Section 4.5.3). These measures may have a positive but temporary impact on investment. At the same time, the notional return on new equity or reinvested earnings exempted from the payment of the corporate income tax ('allowance for corporate equity' (ACE)), which strengthened firms' financial position (Bank of Italy, 2016a, p. 18-19), was reduced from 4.75 % to 2.3 %. Despite the low interest rates, this decision could be premature, considering that banks' financing conditions remain difficult, in particular for SMEs, and that additional equity is needed to support investment in innovation. The reduction of the corporate income tax rate (from 27.5 % to 24 % as of 2017) could help support investment in a more structural manner. Initiatives to support investment in SMEs were also initiated. In September 2016 a multi-pronged 'Industry 4.0' strategy was presented to modernise the industrial sector, mostly through investment in innovation and digital technologies.⁽³⁸⁾ The plan might be constrained by the current lack of digital skills:

⁽³⁸⁾ Only 7 % of SMEs were selling online in 2016 (EU average: 17 %), whereas only 29 % of Italian consumers bought online goods or services (EU average: 55 %).

only 67 % of the population were regular Internet users in 2016, well below the EU average of 79 %. ‘Industry 4.0’ seeks to address this problem among young people, including through new curricula in post-secondary and tertiary education, but the digital skills gaps among the middle-aged workforce and the elderly remains.

Infrastructure gaps*

Access to next-generation communication networks is improving but mostly in densely populated regions. Driven by private operators’ investments, the coverage of the fast broadband network progressed rapidly last year, from 44 % to 72 % of Italian households. However, it is still slightly below the EU average (76 %). In summer 2016, the Italian government launched two calls for tender for a total of EUR 2.6 billion for providing fast broadband access in white areas⁽³⁹⁾. However, the first call for tender is subject to lawsuits by some telecom operators. If the lawsuits are successful, Italy will find it difficult to close the digital infrastructure divide in these areas (accounting for 25 % of the total population).

Transport infrastructure quality is below the EU average, with significant regional variation. The 2016 EU Transport Scoreboard ranks Italy’s performance below the EU average in all main infrastructure quality indicators, and investment is lacking (European Commission, 2016j). In railways, there is a persistent infrastructure gap between northern and southern regions in terms of both infrastructure endowment and traffic management technology. Besides, recent accidents raised interoperability and safety issues in relation to certain local and regional railway lines (*ferrovie ex-concesse*) totalling about 3 000 km. In 2015, Italy presented a national strategic plan for ports and logistics to increase efficiency and rationalise the port sector, but its full implementation is still ongoing. Italy also lags behind (European Commission, forthcoming) in streamlining administrative procedures, the deployment of electronic solutions, launching key trans-European transport projects and ensuring smooth permit procedures, causing delays in project delivery.

Investment in energy efficiency and renewable energy underpins Italy’s positive performance in these areas and in reducing greenhouse gas emissions. Italy is on track to achieve its target to reduce greenhouse gas emissions in sectors not covered by the EU Emissions Trading System (ETS) and to meet the 2020 targets for energy efficiency and renewable energy. The 2017 Budget Law confirmed the tax incentives for improving the energy efficiency of buildings. In 2015, Italy launched a strategy for the energetic requalification of the national housing stock and a plan for the promotion of ‘nearly-zero energy’ buildings. New guidelines on the white-certificate scheme are expected to be adopted in 2017. Italy also has one of the highest installed capacities for electricity production with renewables in the EU. However, the complex legislative framework and tax structure create some barriers to the full deployment of Italy’s renewable potential.

Investment in waste and water treatment could spur a circular economy. A ‘Green Act’ is planned to facilitate this transition. Waste management and water infrastructure, including waste water treatment, are persistent concerns, particularly in southern Italy. Non-compliance with the EU’s Urban Waste Water Treatment Directive is extensive. Investment needs for waste water treatment are estimated at EUR 4.6 billion (European Commission, 2017d). Improving land-use management and reducing air pollution are challenges faced by centre and northern regions as well. Measures were taken to speed up investment in water and flood protection and prevention. In 2015, only around 41 % of Italian small and medium-sized enterprises (SMEs) invested up to 5 % of their annual turnover in resource efficiency actions (EU average: 50 %), and 25 % of SMEs took measures to recycle by reusing material or waste within a company (EU average: 40 %).

⁽³⁹⁾ White areas are areas in which fast broadband is not available at present and in which no operator has plans to invest in next-generation networks in the coming years.

Box 4.4.1: Investment challenges and reforms in Italy

Section 1. Macroeconomic perspective

Since the crisis, the decline in investment in Italy has been sharper than the EU average. It has affected both the private and public sector and both residential and non-residential types of investment, with the latter accounting for two thirds of the total drop. The decline was driven mainly by the fall in demand, the squeeze of Italian firms' profit margins, and tight financing conditions, partly resulting from the banking sector being impaired by the high stock of non-performing loans (see Section 4.2). Italian firms also have relatively more debt than equity, which may limit innovative investment and restrict their access to credit. As demand strengthens and financing conditions improve, private investment is gradually recovering. Public investment is constrained by the reduced fiscal space due to the high public debt (see Section 3).

Section 2. Assessment of barriers to investment and ongoing reforms [to be updated]

Public administration / business environment	Regulatory/administrative burden		Financial sector / taxation	Taxation	CSR	
	Public administration	CSR		Access to finance		
	Public procurement / public-private partnerships (PPPs)			R&D and innovation	Cooperation between academia, research and business	
	Judicial system	CSR			Financing of R&D and innovation	
	Insolvency framework	CSR		Sector-specific regulation	Business services / regulated professions	CSR
Competition and regulatory framework	CSR	Retail	CSR			
Labour market / education	Employment protection legislation / framework for labour contracts		Construction

	Education		Energy			
			Transport	CSR		

Legend:	
	No barrier to investment identified
	Investment barriers also subject to a country-specific recommendation
	No progress
	Limited progress
	Some progress
	Substantial progress
	Fully addressed

In addition to macroeconomic constraints, the overall business environment in Italy is not conducive to investment (see Section 4.5.2).

Main barriers to investment and priority actions underway

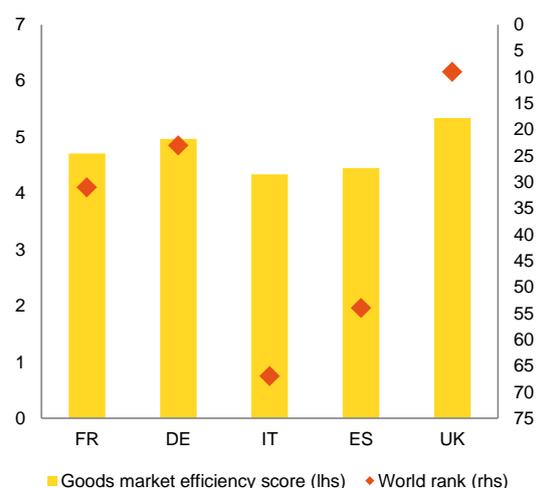

1. Firms' access to finance remains heavily biased towards bank loans where some vulnerabilities persist, while capital markets remain underdeveloped. The latter might be a constraint particularly for young innovative firms. The ongoing and planned reform of the Italian insolvency system, the new impaired loan securitisation scheme and other measures taken over the last two years will help banks to clean up their balance sheets. Ongoing policy action in the banking sector – in particular on banks' corporate governance – could improve the allocation of capital (see Section 4.2).
2. The regulatory and administrative burden remains high and hampers business activities (see Section 4.5.2). Inefficiencies in the public administration, the low quality of Italian regulation, frequent legislative changes and slow enforcement due to lengthy proceedings weaken the effectiveness of Italy's legislation and overall legal certainty (see Section 4.6.2). Some reforms have been adopted or are in the pipeline, in particular in the areas of the judicial system, the labour market and the competition framework, but some issues remain to be addressed (see Sections 4.3, 4.5.1 to 4.6.2).
3. The high level of taxation on productive factors reduces firms' incentives to invest. Some measures have been taken to shift the tax burden away from labour and capital and favour equity financing. However, some recent policy measures partially backtrack on previous reforms, including the reduction of the tax exemption for reinvested earnings or new equity and the abolition of recurrent tax on primary residences (see Section 4.1.2).

4.5. SECTORAL POLICIES

4.5.1. COMPETITION*

Barriers to competition remain significant in Italy. According to the OECD index for product market regulation, Italy's competition framework was substantially converging to the OECD average thanks to a wave of reforms up to 2012. However, in recent years, no major measures have been adopted to open up the Italian economy further. The Global Competitiveness Report 2016-2017 confirms Italy's competition weaknesses (WEF, 2016). The goods market efficiency index includes measures of the level of competition in local markets, the extent of market dominance and the effectiveness of anti-monopoly policy. Italy ranks below all major European peers and 67th in the world (Graph 4.5.1).

Graph 4.5.1: Goods market efficiency, 2016

Notes: The goods market efficiency score ranges from 1 ('very inefficient') to 7 ('very efficient').

Source: World Economic Forum (WEF), 2016

The 2015 annual competition is not yet adopted.

In February 2015, the government presented a draft law on competition, complying for the first time with the 2009 legislation that requires it to present such a draft law every year based on a proposal from the national competition authority. The draft law for 2015 is still under discussion in the Senate, but final adoption is envisaged for Q1 2017. The draft law covers, among others, regulated professions, the insurance sector, the telecommunications industry, and the electricity and gas sectors. Other minor measures concern the banking and fuel distribution sectors. Parliamentary discussions watered down several

provisions, particularly those concerning regulated professions and pharmacies, while new restrictive provisions for the touristic sector were introduced. Reforms are also overdue in other important sectors, with considerable potential economic impact and representing a sizable share of GDP, such as the retail sector, the system of concessions, and the maritime and hydroelectric sectors (European Commission, 2016b). Competition in the last two sectors is still subject to authorisation schemes granted for a long period and without competitive procedures.

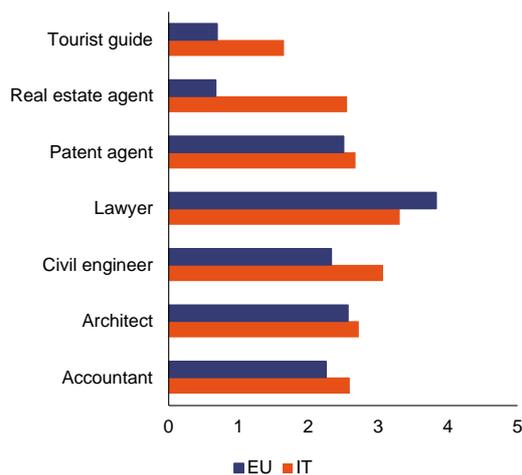

Regulated professions still face important restrictions.

The level of regulatory restrictiveness in Italy is higher than the EU weighted average for all professions, except the legal profession (Graph 4.5.2) (European Commission, 2016k)⁽⁴⁰⁾. In this context, Italy has one of the highest numbers of lawyers in the EU (European Commission, 2017b). Since 2014, Italy reviewed the need for and proportionality of restrictions on access to and the conduct of regulated professions. As a result of this work, a national action plan was submitted in February 2016, defining three cross-cutting lines of action: (i) review of training courses for certain technical professions; (ii) adaptation of state exams for qualifications; (iii) establishment of a technical working group to identify minimum national standards (for regionally regulated professions). The literature suggests that a decrease in regulation has a number of direct and indirect beneficial effects. Reducing the OECD's product market regulation indicator on regulated professions by 1 point is found to increase allocative efficiency by 5.7 percentage points and decrease the concerned sectors' profitability by 5.4 percentage points (Canton et al., 2014). The 2006 reform easing entry into the pharmacy sector is estimated to have contributed to higher employment and higher earnings for young professionals (Pagliero, 2015). The positive effects of deregulation spill over to the whole economy. Professional services represent 10 % of EU market services' value added, account for 4.7 % of total employment and are mostly intermediate factors (Canton et al, 2014). Their level of regulation and efficiency have a large impact on the productivity and

⁽⁴⁰⁾ The Commission has developed a new composite indicator on the restrictiveness of most existing barriers to access to and exercise of regulated professions. It is based on data collected from Member States, complemented by desk research (European Commission, 2016k).

competitiveness of downstream industries and thus of the whole economy.

Graph 4.5.2: Restrictiveness indicator by profession, 2016

Notes: The indicator ranges from 0 ('least regulated') to 5 ('most regulated').

Source: European Commission, 2016k

The competition framework in the energy sectors is sound, but prices remain high. Italy fully unbundled the electricity and gas transmission system operators. In 2015, the market concentration index for power generation (815) was significantly lower than the EU average (3 726). It also remains significantly lower than the EU average for wholesale gas (2 924, as against 4 771 for the EU). Annual switching rates among household consumers have risen for electricity (from 5.8 % in 2011 to 8 % in 2015) and gas (from 5.2 % in 2011 to 6.1 % in 2015) and are already well above the EU average (6 % and 5.3 % respectively). Finally, the planned phasing-out of the protected electric energy and gas market by 2018 is expected further to increase competition and consumer choice. Nevertheless, wholesale prices remain relatively high despite large reductions (-17 % for electricity prices and -21 % for gas prices over 2013-2015, respectively slightly more and slightly less compared to price reductions in other EU countries). Italian retail electricity prices for industry and residential use remain among the highest in Europe.

The Italian Parliament is working on a new framework for the collaborative economy. A survey from the Commission's Eurobarometer finds that 17 % of Italian respondents make use of

collaborative platforms, which is roughly in line with the EU average (European Commission, 2016m). The Italian Parliament is currently discussing a draft legislative initiative ('Sharing Economy Act') to set up a cross-sector framework for collaborative tools. The draft bill proposes an income threshold (EUR 10 000) to differentiate between professionals and peer activities, with the latter subject to a special 10 % tax rate. The draft law also contains requirements for platforms, including registration in a national registry and increased transparency towards platform users.

Transport sectors show significant inefficiencies. Italy's Transport Regulation Authority started to pursue its mandate fully in 2015 by adopting important regulatory measures, including on rail access charges, while staff recruitment is still ongoing. However, weaknesses in the regulatory framework and widespread inefficiencies remain. Local transport services still face a number of weaknesses in terms of quality:

31 % of the users are dissatisfied with the service, while only 9 % register a high level of satisfaction. The EU average figures are 17 % and 19 % respectively (Steer Davies Gleave, 2016). Among the five largest economies in the EU, Italy shows the lowest ratio of operational costs to operational revenues both in rural and metropolitan areas: 33 % and 41 % respectively, as against 55 % and 65 % on average in France, Germany, Spain and the United Kingdom. In-house awards are prevailing (European Commission, 2016b), although local public transport firms selected through competitive tenders show a higher level of productivity (Boitani et al, 2014). This holds regardless of the specific features of the city or territory where the company is operating (Associazione Trasporti, 2015). Motorway concessions are also a chronic issue in Italy, as they are often prolonged without a call for tenders. This generates overcompensation of the concessionaire and hinders competition. Italian authorities announced a pro-market privatisation of the railway incumbent company (*Ferrovie dello Stato*), which has been postponed several times. No specific timeline was provided in the 2016 national reform programme. Similarly, other initiatives, such as the direct re-award of the public service contract for medium- and long-distance rail services to the incumbent operator (*Trenitalia*) until 2026, do little to open markets.

The public procurement system is affected by a number of structural weaknesses. The fragmentation of the legal framework, the low level of administrative capacity and the lack of coordination among institutions make Italian public procurement inefficient. According to European Commission (2016o), many procedures are finalised with only one offer (31 % as against the EU median of 17 %) and decision periods are long (192 days as against the EU median of 79). Furthermore, the value of tender calls published in the *Official Journal of the European Union* as a share of GDP was just above 2 % in 2009-2014 (as against the EU average of 4.4 %).

A new public procurement and concessions code was adopted. The new code (transposing the 2014 EU Directives), entered into force in April 2016, is expected to make arrangements less burdensome and more flexible for businesses. The guidelines on its implementation are being released. This may have generated some uncertainty and significantly slowed down procurement procedures and expenditure. In the three months following the code's adoption, supplies and service contracts dropped respectively by about 30 % and over 40 % in value and volume, while the decrease for public works contracts was about 52 % in value and 62 % in volume (ANAC, 2016). This temporary effect is expected to gradually fade away when the code is fully implemented and the local authorities are more familiar with it (ANAC, 2016).

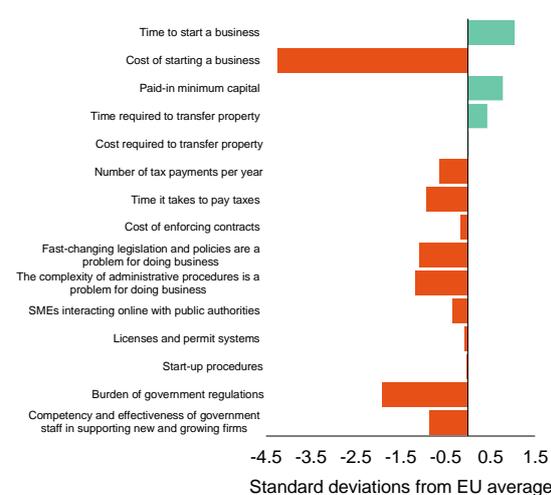

4.5.2. BUSINESS ENVIRONMENT*

Doing business in Italy is still more cumbersome than in peer economies and the quality of regulation is worse. Italy ranks 50th out of 190 economies on the World Bank's 'Doing Business' indicators (World Bank, 2016a). Italy's distance to the best performers is the fourth largest among EU countries, and it made less progress over 2010-2015 than several countries performing similarly (Graph 4.5.4). This is confirmed by the 2016-2017 World Economic Forum Global Competitiveness Report. Despite a slight improvement in the value of the indicator, Italy's competitiveness ranking worsened compared with the previous year, from 43rd to 44th out of 138 countries (WEF, 2016). In particular, Italy only ranks 126th in tax payment, 108th in contract

enforcement and 101st in access to credit. The average time needed to pay taxes is 269 hours per year, as compared with the EU average of 186. Also, 86 % of respondents in Italy cited the complexity of administrative procedures as a problem for doing business (EU average: 62 %). Also, government regulations are considered more burdensome than in the EU on average (1.9 as against 3.24, on a scale from 1 ('most burdensome') to 7 ('least burdensome')). Finally, although the time needed to start a company in Italy is shorter than the EU average, the related cost remains the highest in the EU (Graph 4.5.3) (European Commission, 2016l).

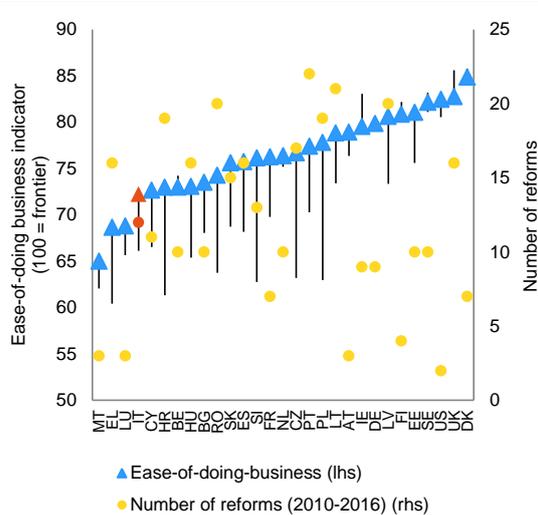

The difficult business environment hampers Italian firms' growth. Italian firms are on average smaller than those in EU peer countries and grow more slowly. SMEs play an important role in the 'non-financial business economy', as they generate 68 % of value added (EU average 57 %) and 79 % of all jobs (EU average: 67 %) (European Commission, 2016b). Italy also differs from the EU average on the importance of micro-firms, which account for 47 % of employment, but with value-added per capita 10 % lower than the EU average. The productivity of micro-firms is only 80 % of the corresponding EU average. As in other countries, it is lower than that of large enterprises (European Commission, 2016b).

Notes: The vertical segment indicates the variation in the indicator between 2010 and 2017 with the maximum and minimum levels reached during the period.

Source: World Bank, 2016a

Efforts to improve the business environment of firms are continuing. In line with the previous year, progress was made in implementing the 2015-2017 Simplification Agenda. A new public procurement code was introduced to make arrangements less burdensome and more flexible. Measures were taken to support e-invoicing, to simplify the procedures for starting a business and to streamline decision-making when several public administrations are involved (see Sections 4.1 and 4.6.1). Efforts were also made to reduce the average payment period, but late payments in some public bodies remain a critical issue. Besides, some e-government measures (*Sistema di Identità Digitale (SPID)*) are being implemented, making online public services more accessible and facilitating the use of electronic payments for the public administration (*PagoPA*). Other measures to boost investment and firms' growth are described in Section 4.4.

4.5.3. RESEARCH AND INNOVATION*

Italy's R&D investment still lags behind that of other EU countries. In 2015, Italy's overall R&D intensity (i.e. total R&D expenditure as a proportion of GDP) was 1.33 %, slightly lower than in 2014 and still significantly below the EU average of 2.03 %. The gap with the EU average

for R&D expenditure by the private sector (0.74 % of GDP in Italy – 14th in the EU – as against the EU average of 1.30 %) remained significantly larger than for public R&D expenditure (0.56 % of GDP in Italy – 17th in the EU – as against the EU average of 0.71 %). Between 2007 and 2015, the Italian government's budget allocated to R&D activities fell from EUR 9.9 billion to EUR 8.3 billion.

The lack of highly-skilled people holds back Italy's innovation performance. Italy still has an insufficient number of highly-skilled people, in particular in science, engineering and computing. This is driven by the country's low tertiary education attainment rate (see Section 4.3.3) and the low number of new graduates in relevant study domains: in 2014, Italy counted 12.5 new graduates in science and engineering and 0.5 new graduates in computing per thousand inhabitants aged 25-34 (as against the EU average of 17.6 and 2.3, respectively). In addition, a significant number of Italian researchers left the country owing to lack of career prospects or more attractive salaries, and this brain drain has so far not been offset by the arrival of foreign researchers.

Other factors also explain Italy's innovation performance lag. Cooperation between academia and business in Italy remains limited, thereby hampering an efficient transfer of knowledge or leverage effect on firms' R&D investment. In 2014, public-private scientific co-publications per million inhabitants in Italy numbered 18 (as against the EU average of 34). Furthermore, in 2014, the volume of research performed by the public research and innovation system funded by businesses amounted to just 0.013 % of GDP (well below the EU average of 0.052 % of GDP), although Italy performs relatively well in terms of the quality of its scientific publications base. In addition, framework conditions for innovation in Italy are unfavourable to the creation and growth of R&D intensive firms. Italy ranks 21st in the EU on the proportion of employment in high-growth enterprises (9.5 % as against the EU average of 13 %), and most of those firms do not operate in knowledge-intensive innovative sectors. Moreover, conservative bank lending policies and the underdevelopment of capital markets hampers innovative start-ups' access to external funding. For instance, in 2015, private venture capitalists'

Box 4.5.1: Selected highlights: Italy's Start-up Act & Industry 4.0 strategy

Italy's Start-up Act ⁽¹⁾ defines a strategy aimed at creating favourable conditions for the establishment and development of innovative enterprises. It also fosters knowledge spillovers to the whole economic fabric and supports a new Italian productive system oriented towards high-tech and high-skill sectors.

This strategy puts together different measures adopted since 2012. In fact, the Italian government has worked since then on the creation of coherent legislation aimed at the development of an ecosystem of innovative start-ups with high technological content. Law 221/2012 included many of the policy proposals put forward in the April 2012 'Restart, Italia!' report by the Ministry of Economic Development, as well as suggestions coming from a consultation with the main players in the Italian start-up ecosystem.

The law introduced a definition of innovative start-ups in the Italian legal system. For the first time, this type of enterprise could draw upon an exhaustive set of regulations and new instruments relevant for the whole lifecycle of a company. Thanks to the law, Italian innovative start-ups can enjoy a number of benefits, such as reductions in red tape and fees, various exemptions, tailor-made labour regulation, a flexible remuneration system, tax credits and incentives for investments, and the possibility to collect equity through crowdfunding portals. The Italian start-up ecosystem has been quite responsive to these policies: at the end of 2016, the number of registered innovative start-ups amounted to 6 745, an increase by 382 units (6 %) compared to the end of September 2016. These innovative start-ups represent 0.42 % of the estimated 1.5 million limited companies active in Italy (up from 0.38 % in June 2016).

Furthermore, the policy for innovative start-ups is in constant evolution: recent interventions have improved and broadened the range of measures. These include the 'Smart&Start Italia' (a subsidised financing scheme for innovative start-ups), the 'Italia Start-up Visa' (a centralised and simplified mechanism for granting work visas to applicants intending to set up a new innovative start-up), and some fiscal benefits such as the 'Patent Box' (which allows companies to exclude for tax purposes 50 % of their income deriving from the commercial use of intangible assets). At the end of 2016, the 'Italia Start-up Visa' programme recorded 161 applications.

Finally, in September 2016, the government presented its new 'Industry 4.0' strategy ⁽²⁾, which aims at modernising production processes and move Italian firms up in the value chain, primarily through the use of fiscal incentives. The plan includes measures to support innovative investment, SMEs' equity financing and preferential treatment for innovative start-ups. To recall a few: (i) a 250 % *iperammortamento* rate to support investment in digitalization; (ii) a 30 % tax deduction for equity investments in start-ups and innovative small and medium-sized enterprises (up to EUR 1 million); (iii) a partial absorption of start-ups' losses by their sponsoring firms during the first four years; (iv) capital gains de-taxation; (v) venture capital funds; (vi) a renewal of the *Nuova Sabatini* law for 2017-2018 which partially covers SMEs' interest expenditure granted on bank loans to invest in new machinery and equipment; (vii) a EUR 1 billion refinancing of the Central Guarantee Fund for SMEs.

⁽¹⁾ <http://www.sviluppoeconomico.gov.it/index.php/it/impresa/competitivita-e-nuove-impreses/start-up-innovative>

⁽²⁾ <http://www.sviluppoeconomico.gov.it/index.php/it/incentivi/impresa/industria-4-0>

investments in Italy represented only 0.003 % of GDP (as against the EU average of 0.024 %).

In addition to the several incentives introduced in previous years, Italy adopted new measures to improve its innovation performance. First, in May 2016, the country launched (with a two-year delay) its new 2015-2020 national research programme, which is fully operational since July 2016. The programme has a budget of EUR 2.5 billion for the 2015-2017 period and is

structured around six priorities (i.e. human capital, internationalisation, research infrastructures, public-private cooperation, southern Italy, and efficiency and quality of public spending). Second, in September 2016, the government presented its new 'Industry 4.0' strategy (see Section 4.4 and Box 4.5.1.).

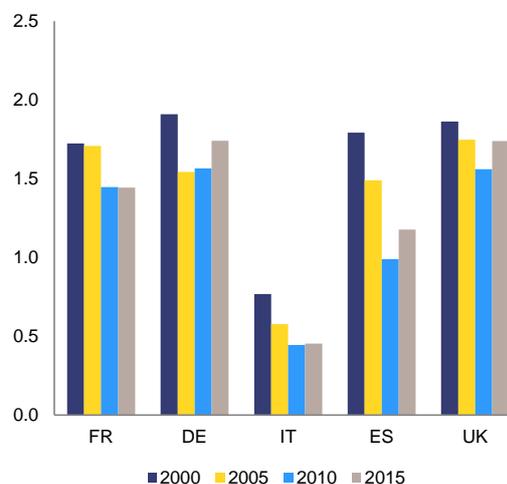

4.6. PUBLIC ADMINISTRATION

4.6.1. PUBLIC ADMINISTRATION*

Italy's public administration is perceived to be less efficient and effective than those of its EU peers. Italy scores worse than its EU peers on most of the World Bank's 2016 worldwide governance indicators. On the government effectiveness indicator, reflecting perceptions of the quality of public services and the capacity of the civil service, Italy scores 0.45, while other major European countries score above 1 (Graph 4.6.1). Unlike most other countries, Italy keeps displaying a negative trend in performance. The trend is confirmed also after taking into account the regulatory quality index, reflecting perceptions of the government's ability to formulate and implement sound policies and regulations. The Commission's Eurobarometer 2016 also ranks Italy as a Member State with one of the highest proportions of citizens judging the public service as 'bad' or 'very bad' (European Commission, 2016p).

The management and quality of civil servants are key to improving Italy's public administration performance. The average age of civil servants is high in Italy (47 years, 4.4 years more than in the private sector). Educational mismatches are also high, with 49 % of jobs that require a university degree occupied by non-graduates (European Commission, 2016b). Selection procedures are still based mainly on textbook knowledge instead of applied problem-solving skills. Moreover, the system of monetary incentives to raise productivity is negligible, and incentives are not clearly related to an effective evaluation system and do not reward merit. Graph 4.6.2 shows the breakdown of a civil servant's average salary (ARAN, 2015). The fixed portion represents more than 80 % of the total wage in most sectors. The portion linked to productivity is relevant only for agencies, which account for some 4 % of all public employment. Thus, improving performance does not lead to substantial benefits for the employees. Lack of monetary incentives is not counterbalanced by career progression. Career and salary progressions seem equally distributed among employees. Managerial and non-managerial careers are on separate paths. The attractiveness of the public administration is thus very weak among highly skilled workers, generating negative self-selection (Bank of Italy, 2016c).

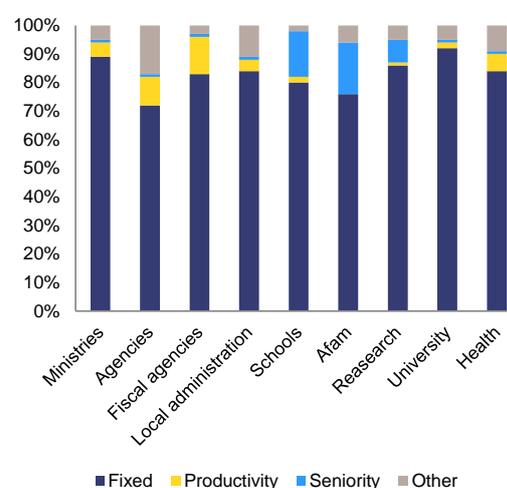

Graph 4.6.1: Government effectiveness indicator, 2016

Notes: Estimate of governance (ranges from approximately -2.5 (weak) to 2.5 (strong) governance performance)

Source: World Bank, 2016b

Graph 4.6.2: Percentage breakdown of the average salary of non-managerial civil servants, 2014

Notes: 'Agencies' are all non-economic agencies. 'Other' refers to the portion of the salary related to special working conditions (e.g. night shifts, public holiday shifts). 'Afam' refers to superior education in music and arts.

Source: European Commission; ARAN, 2015

A reform of the public administration is being implemented. In 2015, a comprehensive enabling law was adopted. The law delegates to the government *inter alia* the reform of the legal framework for public employment at both managerial and non-managerial level. Under the enabling law, the government has adopted several implementing decrees, including on: i) the simplification of the decision-making process and

of citizens' access to public administrations; ii) state-owned enterprises; iii) human resources (management level in the health sector and disciplinary dismissal). In 2016, a draft implementing decree on middle and senior managers was presented. It introduces fixed-term managerial positions, allowing for more flexibility in the administrations. It also increases managers' mobility and strengthens the link between careers and performance. Yet, it keeps the managerial career on a different path than the non-managerial one. The decree on the non-managerial level has not yet been presented. The enabling law envisages the possibility of intervening in civil servants' selection and recruitment, evaluation processes and promotion and salary progression.

The consequences of the Constitutional Court ruling on the content and effectiveness of the reform of the public administration are still to be seen. In November 2016, the Constitutional Court ruled that the procedure followed for three adopted legislative decrees (regulating the management in the health sector, disciplinary dismissals and state-owned enterprises) and for three not yet adopted ones (on local public services and public employment at managerial and non-managerial level) was unconstitutional.⁽⁴¹⁾ While the first three can be amended by a corrective decree (within 12 months given the adoption deadline), the deadlines for the adoption of the decrees on local public services and public managers have expired and the government has not yet clarified how it will address the Constitutional Court ruling for those two decrees. The legislative decree on non-managerial staff has not been published yet and is expected to follow the correct procedure.

Improved public administration will also support a more efficient use of EU funds. Italy agreed to adopt regional (and national) administrative reinforcement plans⁽⁴²⁾ to improve the implementation of European Structural and Investment Funds, in line with a 2015 country-specific recommendation. The plans cover also non-European structural and investment funds and

⁽⁴¹⁾ Ruling 251/2016 states that the government needs to reach an agreement with local administrations when intervening in areas that directly affect the latter, and judged the non-binding opinion foreseen by the law as insufficient.

⁽⁴²⁾ Programma di Rafforzamento Amministrativo (PRA)

administrative capacity-building, and are expected to contribute to the public administration reform.

4.6.2. JUSTICE SYSTEM*

Despite some improvement in the effectiveness of the justice system, the length of proceedings remains a serious challenge. In 2015, Italy's backlog and disposition time for civil litigious cases remained one of the highest in the EU at all instances (European Commission, 2017b).⁽⁴³⁾ In the past five years, some reforms helped to reduce the pending cases at first and second instance⁽⁴⁴⁾ but the backlog still increased at the Supreme Court of Cassation (by 4 % since 2014) (Corte di Cassazione, 2016). In 2016, the Parliament passed a reform of the rules on career, training and discipline of the honorary magistracy and a law to help the Supreme Court reduce its backlog, also by creating 'support offices' to assist cassation judges and allowing the assignment of judges from other departments to work on civil cases. Resources were allocated to digital administrative trials as of 2017. However, the observed downward trend in pending cases started only slowly to translate also into lower disposition time at first instance⁽⁴⁵⁾. Moreover, this seems to relate mostly to recently introduced out-of-court procedures in non-litigious cases⁽⁴⁶⁾, for which the disposition time decreased by 16.5 % between 2010 and 2015, whereas it increased for litigious cases by 6.8 % over the same period. Trial length for civil and commercial proceedings remains a source of concern at higher instances and even shows an upward trend.⁽⁴⁷⁾ As for administrative justice, the backlog continued to decrease but the disposition time remains high.⁽⁴⁸⁾

⁽⁴³⁾ Disposition time was 8.22 years in 2015, namely 527 days at first instance, 1 005 days at the second and 1 469 days at the third.

⁽⁴⁴⁾ Pending litigious cases at first instance went from 6.3 to 4.4 per 100 inhabitants over 2010-2015, also thanks to clearance rates above 100 %.

⁽⁴⁵⁾ At first instance, disposition time decreased by 1.8 % between 2014 and 2015 for other than criminal cases (370 days in 2015). For civil and commercial litigious cases, it increased from 493 days in 2010 to 527 days in 2015.

⁽⁴⁶⁾ Particularly assisted negotiation for separation and divorce

⁽⁴⁷⁾ The average length of civil and commercial litigious cases was 1 026 days at second instance courts and 1 366 days at the Supreme Court in the first nine months of 2016, both above the values recorded in 2015 (source: Ministry of Justice).

⁽⁴⁸⁾ Disposition time for first instance administrative cases was 1 008 days in 2015, broadly stable since 2010 (1 037 days).

Effective case-management, adequate staff and simpler procedures at all instances could support court efficiency. The share of civil cases pending for more than three years remains a major problem of Italy's justice system, although the backlog has decreased since 2013 at all instances except the Supreme Court (Ministry of Justice, 2016). There is ample scope to tackle this issue through effective case-management. The 'Strasbourg 2' project adopted at the end of 2014 aims to monitor long-pending cases and encouraging judges to adopt a 'first-in, first-out' strategy in handling them. The High Council for the Judiciary also developed a handbook of best practices as regards in-court workflow, digitalisation and support offices. Where applied, these practices showed promising results in reducing the backlog and length of proceedings. Wider and more homogeneous application of case-management could extend the efficiency gains to all instances. The current lack of 1 439 out of around 9 921 judges and of administrative staff (up to 30 % in some courts) weighs on the capacity of the judiciary to timely resolve a large number of incoming cases (Corte di Cassazione, 2016). Addressing this shortage, while improving training and equipment and further extending the digitalisation of proceedings, could contribute to support efficiency gains.

The effectiveness of reforms to avoid abuses of the trial remains to be seen. In the past years, Italy passed measures to contain litigation and avoid abuses of the trial⁽⁴⁹⁾, which reportedly weigh on the efficiency of civil justice (Corte di Cassazione, 2012; Davigo and Sisti, 2012; Corte di Cassazione, 2013; Corte di Cassazione, 2015a; Ambrosetti Club, 2016). For instance, the legal interest rate paid by the debtor in a monetary dispute was raised as a deterrence to uncooperative debtors' delaying tactics, admissibility rules for appeals were made stricter by including a reasonable likelihood of success, the principle that the losing party bears the cost of the trial was strengthened, and judges' option to fine vexatious litigation *ex officio* was extended to bad faith in out-of-court procedures⁽⁵⁰⁾. Yet, the still very long

⁽⁴⁹⁾ Source: *Relazione Illustrativa* of Decree Law 132/2014, whereby the aim is to introduce "disincentives to civil justice litigation".

⁽⁵⁰⁾ This includes parties deliberately not taking part in mediation or assisted negotiation. Furthermore, a judge can

average trial length⁽⁵¹⁾ suggests that these measures have not fully delivered, including in effectively increasing procedural discipline. Moreover, doubts may arise on the consistent application of the new admissibility rules at second instance, since only 1.9 % of incoming cases in appeal courts were declared inadmissible.⁽⁵²⁾ It is thus important for the authorities to understand the reasons for this and monitor the impact of these reforms on abuses of the trial.⁽⁵³⁾ The current compulsory legal assistance in mediation appears unnecessary when the parties do not aim to conclude an agreement liable of immediate enforcement without a judge's approval. A comprehensive reform of civil procedural rules now under discussion in the Senate would provide for a further tightening of admissibility criteria for appeals, streamlined civil procedures at all instances and stronger deterrence against vexatious litigation, which may have a positive impact on procedural discipline and trial length.

4.6.3. ANTI-CORRUPTION*

The statute of limitations hinders the fight against corruption. Italy's challenges related to high-level corruption, conflicts of interest, links with organised crime and corruption in the private sector (as highlighted by the 2014 EU Anti-Corruption Report) are still confirmed by several indicators. Italy ranks 26th in the EU for control of corruption, Transparency International gave Italy one of the lowest scores in the EU, and the country was ranked 120th out of 138 countries on favouritism in public officials' decisions and 87th on diversion of public funds (World Bank 2016b; WEF, 2016). Public procurement is a sector at risk, with 29 % of all procedures having only one

sentence the party unjustifiably declining conciliation proposals confirmed by final rulings to pay trial costs.

⁽⁵¹⁾ The average length of civil and commercial litigious cases in the first nine months of 2016 was 9.13 years, namely 941 days at first instance, 1 026 at the second (together with a small share of non-litigious cases) and 1 366 at the third (source: Ministry of Justice).

⁽⁵²⁾ In comparison, in 2015 the Supreme Court declared 13 % of appeals inadmissible (Corte di Cassazione, 2015b), up from 8 % in 2005.

⁽⁵³⁾ The issue of incentives to abusive litigation provided by the Italian legislation has been raised by the Supreme Court of Cassation in its annual reports. See for instance: Corte di Cassazione, 2011, pp. 86-90; Corte di Cassazione, 2015a, pp. 132-133.

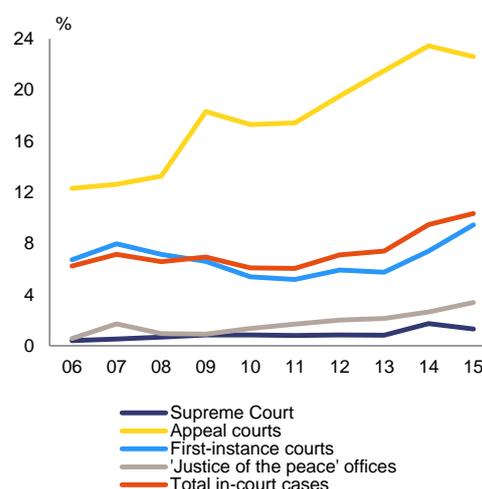

bidder and with 9 % having no call for tenders at all in 2015 (European Commission, 2016o). Reforms were adopted to improve the repression of corruption, but the long-overdue revision of the statute of limitations is still on hold. The current system is a major hindrance to repress corruption, not least as it incentivises lawyers' delaying tactics (European Commission, 2015b).⁽⁵⁴⁾ The ratio of time-barred to resolved criminal cases (Graph 4.6.3) shows that prescriptions at first instance have risen since 2013 to 9.5 % in 2015. Those in appeal courts also increased from 12.3 % to 22.6 % over 2006-2015. The rate of prescription in the Supreme Court is lower but it has been rising in recent years. Overall, a high proportion of cases gets time-barred after first-instance conviction. A draft law introducing a suspension of prescription terms for all criminal trials and a special extension for corruption offences has been in Parliament for two years. While the proposal does not stop prescription terms after a first-instance conviction, (as suggested by the Council of Europe's Group of States against Corruption) it appears to be a step in the right direction. Extending prescription terms could increase incentives to resort to expedited procedures⁽⁵⁵⁾ and reduce abuses of the trial (GRECO, 2016, paragraph 126), thereby contributing to more effective criminal justice. Failure to address this issue in line with EU best practices could undermine public and investor confidence in the rule of law.

The national anti-corruption authority has limited means to exercise its powers, and the prevention framework remains fragmented.

The monitoring powers of the national anti-corruption authority (ANAC) were extended, in particular to cover larger procurement contracts where monitors chosen at random from the authorities' pool sit on tender boards. However, this is not the case for contracts below EU thresholds and those defined (ambiguously) as 'not particularly complex'. Acting through the local prefect, ANAC may also remove contractors involved in corruption or mafia cases, while others

may continue to work to minimise procurement delays. The authority's tasks include analysing the corruption-prevention plans of all administrative bodies and state-owned companies and providing training to the administrations lacking the capacity to develop such plans. However, these powers are not matched by sufficient additional human and financial resources (ANAC, 2016). This shortage compounds Italy's lack of uniform and systematic verification of public officials' assets and conflicts of interest, and a still-fragmented whistle-blower protection framework.

Graph 4.6.3: **Ratio of time-barred criminal cases to total resolved criminal cases per instance**

Notes: 'Total in-court cases' are obtained by the sum of those at all instances plus the judges of the peace. Investigations are not considered here.

Source: Ministry of Justice

⁽⁵⁴⁾ In general, the practitioners' responsibility to contribute, from their part, to procedural discipline is widely acknowledged.

⁽⁵⁵⁾ According to the Code of Criminal Procedure, 'special procedures' are aimed to accelerate proceedings and include the defendant's possibility to ask for a settlement (*patteggiamento*) at the stage of the preliminary hearing.

ANNEX A

Overview table

Commitments

Summary assessment ⁽⁵⁶⁾

2016 country-specific recommendations (CSRs)	
<p>CSR 1: In 2016, limit the temporary deviation from the required 0.5 % of GDP adjustment towards the medium-term budgetary objective to the amount of 0.75 % of GDP allowed for investments and the implementation of structural reforms, subject to the condition of resuming the adjustment path towards the medium-term budgetary objective in 2017. Achieve an annual fiscal adjustment of 0.6 % or more of GDP towards the medium-term budgetary objective in 2017. Finalise the reform of the budgetary process in the course of 2016 and ensure that the spending review is an integral part of it. Ensure the timely implementation of the privatisation programme and use the windfall gains to accelerate the reduction of the general government debt ratio. Shift the tax burden from productive factors onto consumption and property. Reduce the number and scope of tax expenditures and complete the reform of the cadastral system by mid-2017. Take measures to improve tax compliance, including through electronic invoicing and payments</p>	<p>Italy has made some progress in addressing CSR 1 (this overall assessment of CSR 1 does not include an assessment of compliance with the Stability and Growth Pact):</p>
<p>– In 2016, limit the temporary</p>	<p>– The assessment of compliance with the Stability and</p>

⁽⁵⁶⁾ The following categories are used to assess progress in implementing the 2016 country-specific recommendations (CSRs):

No progress: The Member State has not credibly announced nor adopted any measures to address the CSR. Below a number of non-exhaustive typical situations that could be covered under this, to be interpreted on a case by case basis taking into account country-specific conditions:

no legal, administrative, or budgetary measures have been announced in the National Reform Programme or in other official communication to the national Parliament / relevant parliamentary committees, the European Commission, or announced in public (e.g. in a press statement, information on government's website);

no non-legislative acts have been presented by the governing or legislator body;

the Member State has taken initial steps in addressing the CSR, such as commissioning a study or setting up a study group to analyse possible measures that would need to be taken (unless the CSR explicitly asks for orientations or exploratory actions), while clearly-specified measure(s) to address the CSR has not been proposed.

Limited progress: The Member State has:

announced certain measures but these only address the CSR to a limited extent; and/or

presented legislative acts in the governing or legislator body but these have not been adopted yet and substantial non-legislative further work is needed before the CSR will be implemented;

presented non-legislative acts, yet with no further follow-up in terms of implementation which is needed to address the CSR.

Some progress: The Member State has:

adopted measures that partly address the CSR, and/or

adopted measures that address the CSR, but a fair amount of work is still needed to fully address the CSR as only a few of the adopted measures have been implemented. For instance: adopted by national parliament; by ministerial decision; but no implementing decisions are in place.

Substantial progress: The Member State has adopted measures that go a long way in addressing the CSR and most of which have been implemented.

Full implementation: The Member State has implemented all measures needed to address the CSR appropriately.

<p>deviation from the required 0.5 % of GDP adjustment towards the medium-term budgetary objective to the amount of 0.75 % of GDP allowed for investments and the implementation of structural reforms, subject to the condition of resuming the adjustment path towards the medium-term budgetary objective in 2017. Achieve an annual fiscal adjustment of 0.6 % or more of GDP towards the medium-term budgetary objective in 2017.</p>	<p>Growth Pact will be made in Spring.</p>
<p>– Finalise the reform of the budgetary process in the course of 2016 and ensure that the spending review is an integral part of it.</p>	<p>– Substantial progress has been made in reforming the budgetary process. A comprehensive reform of the process was passed in 2016. Its full implementation is expected in the 2018 Budget Law, which would make the spending review a more integral part of the budgeting process.</p>
<p>– Ensure the timely implementation of the privatisation programme and use the windfall gains to accelerate the reduction of the general government debt ratio.</p>	<p>– Limited progress has been made in implementing the privatisation programme and in using the windfall gains to reduce public debt. In 2016, Italy has underachieved its privatisation targets (at 0.1 % of GDP in 2016 versus the planned 0.5 %) and the lower interest rate expenditure was counterbalanced by increased primary expenditure.</p>
<p>– Shift the tax burden from productive factors onto consumption and property.</p>	<p>– Some progress has been made in shifting the tax burden from productive factors onto consumption and property. Italy's 2017 Budget Law contains several measures affecting the tax wedge on labour, including lower tax rates on productivity premia agreed in decentralised bargaining, an exemption from the payment of social security contributions for certain new hires, and the reduction of the social security contributions rate for the self-employed. These measures compound more sizeable measures taken in 2014 and 2015 to reduce the labour tax wedge.</p>
<p>– Reduce the number and scope of</p>	<p>– Limited progress has been made in reducing the number</p>

<p>tax expenditures and complete the reform of the cadastral system by mid-2017.</p>	<p>and scope of tax expenditures and in completing the reform of the cadastral system.</p>
<p>– Take measures to improve tax compliance, including through electronic invoicing and payments.</p>	<p>– Limited progress has been made in improving tax compliance. The 2017 Budget Law introduces a new tax on business income (IRI) to harmonise the tax system of small firms and corporations. It also introduces transparency provisions on the communication of invoices and VAT data, and a reform of tax administration, merging the tax-recovery agency (<i>Equitalia</i>) with the revenue agency. Sanctions and fines related to unpaid taxes in 2000-2015 are waived for taxpayers spontaneously regularising their tax position.</p>
<p>CSR 2: Implement the reform of the public administration by adopting and implementing all necessary legislative decrees, in particular those reforming publicly owned enterprises, local public services and the management of human resources. Step up the fight against corruption including by revising the statute of limitations by the end of 2016. Reduce the length of civil justice proceedings by enforcing reforms and through effective case-management.</p>	<p>Italy has made limited progress in addressing CSR 2:</p>
<p>– Implement the reform of the public administration by adopting and implementing all necessary legislative decrees, in particular those reforming publicly owned enterprises, local public services and the management of human resources.</p>	<p>– Limited progress has been made in implementing the public administration reform. Several implementing decrees have been adopted. However, on 25 November 2016, the Constitutional Court ruled that the procedure envisaged was unconstitutional for the decrees pointed out in the recommendations, notably those concerning human resource management, local public services and publicly-owned enterprises. Some of them had been already adopted (those regulating the management level in the health sector, disciplinary dismissals and state-owned enterprises) and have therefore to be amended. For two decrees, (on local public services and public managers), the delegation had already expired. The decree on non-managerial staff was also concerned, but it can still be adopted under the enabling law with the correct procedure.</p>
<p>– Step up the fight against corruption including by revising the statute of limitations by the end of 2016.</p>	<p>– No progress has been made in revising the statute of limitations.</p>

<p>– Reduce the length of civil justice proceedings by enforcing reforms and through effective case-management.</p>	<p>– Some progress has been made in enforcing civil justice reform and improving case-management but the length of proceedings is not decreasing.</p>
<p>CSR 3: Accelerate the reduction in the stock of non-performing loans, including by further improving the framework for insolvency and debt collection. Swiftly complete the implementation of ongoing corporate governance reforms in the banking sector.</p>	<p>Italy has made some progress in addressing CSR 3:</p>
<p>– Accelerate the reduction in the stock of non-performing loans,</p>	<p>– Limited progress has been made in reducing non-performing loans (NPLs). In April 2016, a law was passed creating an NPL securitisation scheme supported by state guarantees (GACS), which became operational in August 2016 with the adoption of an implementing decree. Since April 2016, two private-sector backstop funds (Atlante I and II) have been set up to support the recapitalisation and the impaired asset disposal of vulnerable banks. Furthermore, the Bank of Italy has issued a new reporting template requiring banks to provide detailed data on their bad loans, collateral and ongoing recovery procedures. Although all these measures — including several reforms of insolvency and collateral enforcement rules — are in principle helpful in fostering the development of a secondary market for distressed assets in Italy, they have not yet resulted in significant short-term relief for the banking sector. In December 2016, the government approved the setup of a EUR 20 billion fund for the precautionary recapitalisation of and liquidity support for vulnerable banks, but it is not yet clear whether this will be a turning-point in the clean-up of the Italian banking sector.</p>
<p>including by further improving the framework for insolvency and debt collection.</p>	<p>– Some progress has been made in improving the framework for insolvency and debt collection. In June 2016, further changes to Italy’s insolvency and collateral enforcement rules were made. <i>Inter alia</i>, provisions authorise private enforcement clauses in loan contracts allowing creditors to take ownership of collateral out-of-court in the event of a debtor’s default (<i>patto marciano</i>), and enable entrepreneurs to pledge movable assets while continuing to use them (a kind of non-possessory lien). Furthermore, an electronic register for insolvency cases will be set up, and hearings can now be held electronically. The reforms complement those of 2015, but it may take some time before their results in terms of shorter proceedings and higher recovery values</p>

	<p>— essential for NPL market activity — materialise. In the meantime, a draft enabling law aiming to fundamentally overhaul the insolvency and enforcement framework is currently under parliamentary discussion.</p>
<p>– Swiftly complete the implementation of ongoing corporate governance reforms in the banking sector.</p>	<p>– Some progress has been made in implementing corporate governance reform. With the adoption of a law in April 2016 and implementing provisions by the Bank of Italy in November 2016, the 18-month implementation period started for the self-reform of the segment of small mutual banks (<i>banche di credito cooperativo</i> (BCCs)). BCCs wishing to retain their cooperative status will have to join one of the cooperative banking groups that will be set up, and their relationship with the group’s holding company will be determined by risk-based ‘cohesion contracts’. The implementation of the 2015 reforms of large cooperative banks (<i>banche popolari</i>) and bank foundations has continued, although legal challenges and unfavourable market conditions have led to some delays.</p>
<p>CSR 4: Implement the reform of active labour market policies, in particular by strengthening the effectiveness of employment services. Facilitate the take-up of work for second earners. Adopt and implement the national antipoverty strategy and review and rationalise social spending.</p>	<p>Italy has made some progress in addressing CSR 4:</p>
<p>– Implement the reform of active labour market policies, in particular by strengthening the effectiveness of employment services.</p>	<p>– Some progress has been made in implementing the reform of ALMPs. The new Agency in charge of active labour market policies (ANPAL) is operational as of January 2017. A pilot outplacement voucher (<i>assegno di ricollocazione</i>) scheme was launched in November 2016 covering a sample of 30 000 beneficiaries.</p>
<p>– Facilitate the take-up of work for second earners.</p>	<p>– Limited progress has been made in facilitating the take-up of work by second earners. The 2017 Budget Law extends paternity leave from two to four days as of 2018. It also extends to 2017 and 2018 the possibility, first introduced in 2012, to exchange parental leave with babysitting vouchers and introduces a non-means-tested voucher for EUR 1 000 per year to be spent in public or private nurseries.</p>
<p>– Adopt and implement the national antipoverty strategy and review and rationalise social spending.</p>	<p>– Some progress has been made with regard to the national antipoverty strategy. The active inclusion measure (SIA), which provides economic and social care to disadvantaged households, was rolled out at national level. An enabling law aimed at establishing a single comprehensive scheme against poverty, replacing SIA</p>

	and the unemployment assistance scheme (ASDI), has been approved by the Chamber of Deputies.
CSR 5: Swiftly adopt and implement the pending law on competition. Take further action to increase competition in regulated professions, the transport, health and retail sectors and the system of concessions.	Italy has made limited progress in addressing CSR 5:
– Swiftly adopt and implement the pending law on competition.	– No progress has been made with regard to the pending law on competition. The draft law was presented to Parliament in April 2015 and has not yet been approved by the Senate.
– Take further action to increase competition in regulated professions, the transport, health and retail sectors and the system of concessions.	– Limited progress has been made in addressing remaining barriers to competition in regulated professions, the transport, health and retail sectors and the system of concessions. The code for public procurement and concessions was revised in 2016. No further measures were taken to remove remaining barriers to competition in the other sectors.

Europe 2020 (national targets and progress)	
Employment rate target: 67 %-69 %	The employment rate has shown some signs of recovery, increasing to 60.5 % in 2015 (compared with 59.9 % in 2014). However, it is still far from the target.
R&D target: 1.53 % of GDP	Italy's R&D investment stood at 1.33 % of GDP in 2015. Therefore, there is only limited progress towards the target. In recent years, Italy has been cutting its public research and innovation budget at a higher rate than the overall public budget. This trend keeps Italy's public sector R&D intensity — 0.56 % of GDP in 2015 — at a significantly lower level than the EU average (0.71 %), while business R&D intensity stood at 0.74 % of GDP in 2015, also much lower than the EU average (1.3 % of GDP).
Greenhouse gas emissions target: -13 % in non-ETS sectors (compared with emissions in	According to the latest national projections submitted to the European Commission in 2015 and taking into account existing measures, emissions are projected to

2005)	<p>decrease by 18 % by 2020 as compared with 2005. Therefore, Italy is on track to reach its 2020 greenhouse gas emission reduction target, with a 5 % margin.</p> <p>According to approximated data for 2015, emissions decreased by 19 % between 2005 and 2015.</p>
Renewable energy target: 17 %	<p>With a renewable energy share of 17.1 % in 2015, Italy has already reached the 2020 target. The share of renewable electricity generation in final electricity consumption and in heating and cooling more than doubled between 2005 and 2014, increasing from 16.3 % to 33.4 % and from 8.2 % to 18.9 % respectively. However, past changes in support schemes for renewables (e.g. retroactive cuts in feed-in tariffs for existing projects), the uncertainty about the post-2016 regulatory framework for renewables, and persistent burdensome administrative procedures limited market growth during in the last couple of years. ⁽⁵⁷⁾</p>
Energy efficiency target: 158 Mtoe (absolute level of primary energy consumption) / 124 Mtoe (absolute level of final energy consumption)	<p>Italy increased its primary energy consumption by 4 % from 143.84 Mtoe in 2014 to 149.56 Mtoe in 2015. Final energy consumption increased by 3 % from 113.35 Mtoe in 2014 to 116.44 Mtoe in 2015. Even if Italy has already achieved levels of primary and final energy consumption which are below the indicative national 2020 targets, it would need to make an effort to maintain these levels until 2020.</p>
Early school leaving target: 16 %	<p>Italy has met this target. The early school leaving rate (the percentage of the population aged 18-24 with at most lower secondary education and not in further education or training) fell from 16.8 % in 2013 to 15 % in 2014 and 14.7 % in 2015.</p>
Tertiary education target: 26 %-27 %	<p>Italy has made some progress towards achieving this target. The tertiary educational attainment rate rose to 25.3 % in 2015 from 23.9 % in 2014 and 22.5 % in 2013.</p>
Risk of poverty or social exclusion target: -	<p>Not only is there no progress towards achieving this</p>

⁽⁵⁷⁾ Renewable energy shares for 2015 are approximations and not official data, reflecting the available data (4 October 2016). See the Öko-Institut Report: Study on Technical Assistance in Realisation of the 2016 Report on Renewable Energy, <http://ec.europa.eu/energy/en/studies>

2.2 million people at risk of poverty or social exclusion (compared with the number of people in 2008, thus corresponding to a target of 12.9 million people at risk of poverty or social exclusion in 2020)

target, but the situation has further deteriorated. The proportion of people at risk of poverty or social exclusion was 28.7 % in 2015 (slightly higher than in 2014, when it was 28.3 %, and still much higher than in 2008, when it was 25.5 %).

ANNEX C

Standard tables

Table C.1: **Financial market indicators**

	2011	2012	2013	2014	2015	2016
Total assets of the banking sector (% of GDP)	248.1	261.6	252.3	248.2	238.6	234.9
Share of assets of the five largest banks (% of total assets)	39.5	39.7	39.6	40.7	41.1	-
Foreign ownership of banking system (% of total assets)	13.4	13.4	12.4	12.7	12.7	-
Financial soundness indicators: ⁽¹⁾						
- non-performing loans (% of total loans)	9.5	11.0	12.9	15.8	16.0	15.6
- capital adequacy ratio (%)	12.7	13.4	13.7	14.2	14.8	15.0
- return on equity (%) ⁽²⁾	-13.0	-1.0	-11.5	-2.8	3.1	1.5
Bank loans to the private sector (year-on-year % change)	0.9	1.7	-3.5	-0.8	-0.6	-1.1
Lending for house purchase (year-on-year % change)	4.4	-0.5	-1.1	-0.9	0.4	1.5
Loan to deposit ratio	125.1	117.3	111.0	108.2	102.7	100.5
Central Bank liquidity as % of liabilities	6.8	8.4	7.7	6.2	5.1	5.9
Private debt (% of GDP)	122.7	125.1	121.9	120.1	117.0	-
Gross external debt (% of GDP) ⁽¹⁾ - public	38.2	41.0	43.2	50.3	51.2	51.4
- private	27.9	30.6	31.2	30.9	29.9	31.1
Long-term interest rate spread versus Bund (basis points)*	281.6	399.8	274.7	172.9	121.8	137.5
Credit default swap spreads for sovereign securities (5-year)*	242.6	323.2	199.7	101.6	92.2	107.8

(1) Latest data Q2 2016.

(2) Quarterly values are not annualised

* Measured in basis points.

Source: European Commission (long-term interest rates); World Bank (gross external debt); Eurostat (private debt); ECB (all other indicators)

Table C.2: Labour market and social indicators

	2011	2012	2013	2014	2015	2016 ⁽⁴⁾
Employment rate (% of population aged 20-64)	61.0	60.9	59.7	59.9	60.5	61.5
Employment growth (% change from previous year)	0.3	-0.3	-1.8	0.1	0.6	1.4
Employment rate of women (% of female population aged 20-64)	49.9	50.5	49.9	50.3	50.6	51.5
Employment rate of men (% of male population aged 20-64)	72.5	71.5	69.7	69.7	70.6	71.6
Employment rate of older workers (% of population aged 55-64)	37.8	40.3	42.7	46.2	48.2	50.1
Part-time employment (% of total employment, aged 15-64)	15.2	16.8	17.6	18.1	18.3	18.5
Fixed-term employment (% of employees with a fixed term contract, aged 15-64)	13.3	13.8	13.2	13.6	14.1	13.9
Transitions from temporary to permanent employment	21.7	17.5	21.2	18.6	19.6	-
Unemployment rate ⁽¹⁾ (% active population, age group 15-74)	8.4	10.7	12.1	12.7	11.9	11.6
Long-term unemployment rate ⁽²⁾ (% of labour force)	4.3	5.6	6.9	7.7	6.9	6.7
Youth unemployment rate (% active population aged 15-24)	29.2	35.3	40.0	42.7	40.3	37.5
Youth NEET ⁽³⁾ rate (% of population aged 15-24)	19.7	21.0	22.2	22.1	21.4	-
Early leavers from education and training (% of pop. aged 18-24 with at most lower sec. educ. and not in further education or training)	17.8	17.3	16.8	15.0	14.7	-
Tertiary educational attainment (% of population aged 30-34 having successfully completed tertiary education)	20.4	21.9	22.5	23.9	25.3	-
Formal childcare (30 hours or over; % of population aged less than 3 years)	16.0	11.0	14.0	14.0	-	-

(1) The unemployed persons are all those who were not employed but had actively sought work and were ready to begin working immediately or within 2 weeks.

(2) Long-term unemployed are those who have been unemployed for at least 12 months.

(3) Not in education employment or training.

(4) Average of first three quarters of 2016. Data for total unemployment and youth unemployment rates are seasonally adjusted.

Source: European Commission (EU Labour Force Survey).

Table C.3: Labour market and social indicators (continued)

Expenditure on social protection benefits (% of GDP)	2010	2011	2012	2013	2014	2015
Sickness/healthcare	7.0	6.8	6.8	6.8	6.8	:
Disability	1.6	1.5	1.7	1.7	1.7	:
Old age and survivors	16.3	16.2	16.6	17.0	16.9	:
Family/children	1.1	1.2	1.2	1.2	1.6	:
Unemployment	1.5	1.5	1.6	1.7	1.7	:
Housing	0.0	0.0	0.0	0.0	0.0	:
Social exclusion n.e.c.	0.2	0.2	0.2	0.2	0.2	:
Total	27.6	27.4	28.0	28.7	28.8	:
of which: means-tested benefits	1.6	1.6	1.6	1.6	2.0	:
Social inclusion indicators	2010	2011	2012	2013	2014	2015
People at risk of poverty or social exclusion ¹ (% of total population)	25.0	28.1	29.9	28.5	28.3	28.7
Children at risk of poverty or social exclusion (% of people aged 0-17)	29.5	31.5	34.1	32.0	32.1	33.5
At-risk-of-poverty rate ² (% of total population)	18.7	19.8	19.5	19.3	19.4	19.9
Severe material deprivation rate ³ (% of total population)	7.4	11.1	14.5	12.3	11.6	11.5
Proportion of people living in low work intensity households ⁴ (% of people aged 0-59)	10.6	10.5	10.6	11.3	12.1	11.7
In-work at-risk-of-poverty rate (% of persons employed)	9.5	11.0	11.0	11.0	11.0	11.5
Impact of social transfers (excluding pensions) on reducing poverty	21.1	19.5	20.4	21.5	21.5	21.7
Poverty thresholds, expressed in national currency at constant prices ⁵	9000	8858	8611	8212	8118	8147
Gross disposable income (households; growth %)	-0.1	2.6	-2.7	0.4	0.5	0.8
Inequality of income distribution (S80/S20 income quintile share ratio)	5.4	5.7	5.6	5.8	5.8	5.8
GINI coefficient before taxes and transfers	49.6	50.7	51.0	51.6	51.7	:
GINI coefficient after taxes and transfers	31.2	31.9	32.4	32.8	32.4	:

(1) People at risk of poverty or social exclusion : individuals who are at risk of poverty and/or suffering from severe material deprivation and/or living in households with zero or very low work intensity.

(2) At-risk-of-poverty rate : proportion of people with an equivalised disposable income below 60 % of the national equivalised median income.

(3) Proportion of people who experience at least four of the following forms of deprivation: not being able to afford to i) pay their rent or utility bills, ii) keep their home adequately warm, iii) face unexpected expenses, iv) eat meat, fish or a protein equivalent every second day, v) enjoy a week of holiday away from home once a year, vi) have a car, vii) have a washing machine, viii) have a colour TV, or ix) have a telephone.

(4) People living in households with very low work intensity: proportion of people aged 0-59 living in households where the adults (excluding dependent children) worked less than 20 % of their total work-time potential in the previous 12 months.

(5) For EE, CY, MT, SI and SK, thresholds in nominal values in euros; harmonised index of consumer prices = 100 in 2006 (2007 survey refers to 2006 incomes)

Table C.4: Product market performance and policy indicators

Performance indicators	2010	2011	2012	2013	2014	2015
Labour productivity (real, per person employed, year-on-year % change)						
Labour productivity in industry	8.62	1.13	1.62	0.59	0.59	1.15
Labour productivity in construction	-1.49	-3.34	2.75	5.53	-1.98	-0.94
Labour productivity in market services	2.11	0.09	-1.54	0.87	0.73	-0.32
Unit labour costs (ULC) (whole economy, year-on-year % change)						
ULC in industry	-5.78	1.68	1.37	1.84	0.84	1.13
ULC in construction	2.34	4.93	-0.35	-4.45	0.48	2.39
ULC in market services	-0.40	1.44	2.02	1.01	0.40	1.84
Business environment	2010	2011	2012	2013	2014	2015
Time needed to enforce contracts ⁽¹⁾ (days)	1210.0	1210.0	1185.0	1185.0	1185.0	1120.0
Time needed to start a business ⁽¹⁾ (days)	7.0	7.0	8.0	8.0	7.0	6.5
Outcome of applications by SMEs for bank loans ⁽²⁾	0.74	0.80	1.08	0.95	1.06	0.58
Research and innovation	2010	2011	2012	2013	2014	2015
R&D intensity	1.22	1.21	1.27	1.31	1.38	1.33
Total public expenditure on education as % of GDP, for all levels of education combined	4.50	4.29	4.20	4.28	-	-
Number of science & technology people employed as % of total employment	31	32	33	33	33	34
Population having completed tertiary education ⁽³⁾	13	13	14	14	15	16
Young people with upper secondary education ⁽⁴⁾	77	77	78	78	80	80
Trade balance of high technology products as % of GDP	-1.15	-0.91	-0.61	-0.43	-0.41	-0.54
Product and service markets and competition				2003	2008	2013
OECD product market regulation (PMR) ⁽⁵⁾ , overall				na	1.49	1.26
OECD PMR ⁽⁵⁾ , retail				3.85	4.06	3.15
OECD PMR ⁽⁵⁾ , professional services				3.55	3.02	2.10
OECD PMR ⁽⁵⁾ , network industries ⁽⁶⁾				2.97	2.45	2.01

(1) The methodologies, including the assumptions, for this indicator are shown in detail at :

<http://www.doingbusiness.org/methodology>.

(2) Average of the answer to question Q7B_a. '[Bank loan]: If you applied and tried to negotiate for this type of financing over the past six months, what was the outcome?'. Answers were scored as follows: zero if received everything, one if received most of it, two if only received a limited part of it, three if refused or rejected and treated as missing values if the application is still pending or if the outcome is not known.

(3) Percentage population aged 15-64 having completed tertiary education.

(4) Percentage population aged 20-24 having attained at least upper secondary education.

(5) Index: 0 = not regulated; 6 = most regulated. The methodologies of the OECD product market regulation indicators are shown in detail at : <http://www.oecd.org/competition/reform/indicatorsofproductmarketregulationhomepage.htm>

(6) Aggregate OECD indicators of regulation in energy, transport and communications.

Source: European Commission; World Bank — Doing Business (for enforcing contracts and time to start a business); OECD (for the product market regulation indicators); SAFE (for outcome of SMEs' applications for bank loans).

Table C.5: Green growth

Green growth performance		2010	2011	2012	2013	2014	2015
Macroeconomic							
Energy intensity	kgoe / €	0.11	0.11	0.11	0.10	0.10	0.10
Carbon intensity	kg / €	0.35	0.34	0.33	0.31	0.30	-
Resource intensity (reciprocal of resource productivity)	kg / €	0.46	0.45	0.39	0.35	0.36	0.36
Waste intensity	kg / €	0.11	-	0.11	-	0.11	-
Energy balance of trade	% GDP	-3.2	-3.6	-3.8	-3.3	-2.6	-
Weighting of energy in HICP	%	7.54	8.37	9.57	10.02	9.11	9.96
Difference between energy price change and inflation	%	-3.3	5.0	9.2	0.1	-3.7	-2.8
Real unit of energy cost	% of value added	12.4	13.8	14.1	13.7	13.7	-
Ratio of environmental taxes to labour taxes	ratio	0.13	0.14	0.16	0.16	0.17	-
Environmental taxes	% GDP	2.8	3.0	3.5	3.4	3.6	-
Sectoral							
Industry energy intensity	kgoe / €	0.13	0.12	0.12	0.11	0.11	0.11
Real unit energy cost for manufacturing industry excl. refining	% of value added	18.3	19.6	19.3	18.8	18.9	-
Share of energy-intensive industries in the economy	% GDP	8.63	8.64	8.76	8.67	8.48	8.47
Electricity prices for medium-sized industrial users	€ / kWh	0.14	0.16	0.17	0.17	0.17	0.16
Gas prices for medium-sized industrial users	€ / kWh	0.03	0.03	0.04	0.04	0.04	0.03
Public R&D for energy	% GDP	0.02	0.02	0.02	0.02	0.02	0.02
Public R&D for environmental protection	% GDP	0.02	0.02	0.02	0.01	0.02	0.01
Municipal waste recycling rate	%	31.0	35.5	38.4	39.4	45.6	43.5
Share of GHG emissions covered by ETS*	%	39.4	40.1	39.9	37.6	36.6	36.3
Transport energy intensity	kgoe / €	0.61	0.62	0.61	0.61	0.64	0.63
Transport carbon intensity	kg / €	1.75	1.76	1.64	1.63	1.67	-
Security of energy supply							
Energy import dependency	%	82.6	81.4	79.2	76.8	75.9	77.1
Aggregated supplier concentration index	HHI	14.4	12.9	13.8	16.0	13.3	-
Diversification of energy mix	HHI	0.32	0.31	0.30	0.29	0.29	-

All macro intensity indicators are expressed as a ratio of a physical quantity to GDP (in 2005 prices)

Energy intensity: gross inland energy consumption (in kgoe) divided by GDP (in EUR)

Carbon intensity: greenhouse gas emissions (in kg CO₂ equivalents) divided by GDP (in EUR)

Resource intensity: domestic material consumption (in kg) divided by GDP (in EUR)

Waste intensity: waste (in kg) divided by GDP (in EUR)

Energy balance of trade: the balance of energy exports and imports, expressed as % of GDP

Weighting of energy in HICP: the proportion of 'energy' items in the consumption basket used for the construction of the HICP

Difference between energy price change and inflation: energy component of HICP, and total HICP inflation (annual % change)

Real unit energy cost: real energy costs as a percentage of total value added for the economy

Environmental taxes over labour taxes and GDP: from European Commission's database, 'Taxation trends in the European Union'

Industry energy intensity: final energy consumption of industry (in kgoe) divided by gross value added of industry (in 2005 EUR)

Real unit energy costs for manufacturing industry excluding refining: real costs as a percentage of value added for manufacturing sectors

Share of energy-intensive industries in the economy: share of gross value added of the energy-intensive industries in GDP

Electricity and gas prices for medium-sized industrial users: consumption band 500–20 000 MWh and 10 000–100 000 GJ; figures excl. VAT.

Recycling rate of municipal waste: ratio of recycled and composted municipal waste to total municipal waste

Public R&D for energy or for the environment: government spending on R&D for these categories as % of GDP

Proportion of GHG emissions covered by EU Emissions Trading System (ETS) (excluding aviation): based on greenhouse gas emissions

(excl land use, land use change and forestry) as reported by Member States to the European Environment Agency.

Transport energy intensity: final energy consumption of transport activity (kgoe) divided by transport industry gross value added (in 2005 EUR)

Transport carbon intensity: GHG emissions in transport activity divided by gross value added of the transport sector

Energy import dependency: net energy imports divided by gross inland energy consumption incl. consumption of international bunker fuels

Aggregated supplier concentration index: covers oil, gas and coal. Smaller values indicate larger diversification and hence lower risk.

Diversification of the energy mix: Herfindahl index over natural gas, total petrol products, nuclear heat, renewable energies and solid fuels
